APPROVED FOR PUBLIC RELEASE;
DISTRIBUTION UNLIMITED

This final report was submitted by The Aerospace Corporation, El Segundo, CA 90245, under contract F04701-76-C-0077 with the Space and Missile Systems Organization, Deputy for Space Communications Systems, P.O. Box 92960, Worldway Postal Center, Los Angeles, CA 90009. It was reviewed and approved for The Aerospace Corporation by E. Wade, Aerospace Systems Support Group, and L. Katzin, Engineering Science Operations. Colonel W. L. Bagwell, SAMSO/PPG, was the project officer.

This report has been reviewed by the Office of Information (OI) and is releasable to the National Technical Information Service (NTIS). At NTIS it will be available to the general public, including foreign nations.

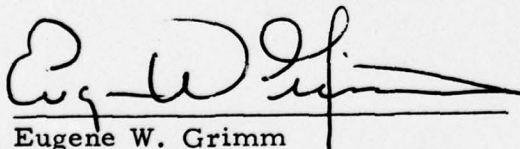

This technical report has been reviewed and is approved for publication. Publication of this report does not constitute Air Force approval of the report's findings or conclusions. It is published only for the exchange and stimulation of ideas.

1. INTRODUCTION

On 22 and 23 March, SAMSO and Aerospace sponsored a unique conference on the rework and repair of already assembled printed circuit boards. Although there have been many conferences relating to the design, fabrication, and testing of space and missile systems and components, little attention has been directed towards repair and rework problems. This conference was intended to provide a forum for the exchange of industry and government experiences, problems, and solutions in this specialized area. Printed circuit boards are used in space and missile systems to mount and interconnect the thousands of electronic parts in the various electronic components. Although it is everyone's intention to perfectly assemble the parts on each printed circuit board, and to never rework the boards after assembly, cost and schedule considerations require the repair or rework in many situations. Fundamentally these situations develop as a result of poor workmanship, a part failure, or a design change.

For example, the final inspection on a completely assembled printed wiring board, worth hundreds of dollars, may uncover minor discrepancies such as scratches in conductors, voids in conformal coating, lack of bonding of a conductor, or an improperly soldered connection. In such cases, a repair procedure is appropriate if it can reduce the degree of nonconformance to an acceptable level. The high levels of reliability required by space systems result in setting levels of workmanship that are difficult to achieve. These high levels may then result in repeated rework on the same assembly in an attempt to achieve the desired perfection.

As another example, a \$2 resistor might fail during ground tests of a space vehicle. The resistor may be mounted on a printed circuit board with 10 integrated circuits each costing \$500. Should the entire board be scrapped or should the failed resistors be replaced by reworking the assembled board?

The answer in this example is not as simple as it might seem. Before the decision on whether to scrap or repair can be made, the reason for the failure should be found. This is necessary to ensure that the resistor failure was not caused by a failure of some other part or by the test equipment. In other words, one should determine that replacing the resistor will not simply result in the failure of the new resistor when the test is repeated. In addition, when the resistor failed, it may have overheated other parts or it may have caused an over-voltage or over-current condition in adjoining circuitry. Before the repair decision can be made, one must determine the total extent of the repair by identifying other parts that would also require replacing because of the overstress associated with the failure.

Having made a decision to repair an assembled printed circuit board, the contractor faces the problems addressed in the conference. How should the rework be done so that the resulting board is as reliable as a newly assembled one? How do you know that the rework was accomplished satisfactorily?

These proceedings of the conference contain the presentation material used. The conference was jointly arranged by Col. W. Bagwell, SAMSO Director of Manufacturing and Quality Control; Len Katzin of the Aerospace Reliability and Components Department; J. Egan, Associate Head of the Reliability and Components Department; and E. Wade, Director of the Aerospace Systems Support Group. Mr. Katzin organized the technical sessions and made a presentation on "Future Trends." The conference was attended by 150 industry representatives, 25 SAMSO representatives, 25 Aerospace personnel, and 40 individuals from other government agencies.

2. MEETING AGENDA

The agenda of the Conference on Rework and Repair of Printed Circuit Boards, held on March 22 and 23, 1977 at The Aerospace Corporation, consisted of the following items:

- | | |
|------------|--|
| 1. Welcome | Col W. Bagwell, SAMSO, Dir. of
Manufacturing and Quality Assurance
Col F. McCartney, SAMSO, Deputy
for Space Communications |
|------------|--|

First Session - 9:00 AM March 22, 1977

- | | |
|---|---|
| 2. Introduction | C. Holzbauer, TRW Systems |
| 3. Rework and Repair - The
Definition (Appendix A) | V. J. Petrusis, TRW Defense and
Space Systems |
| 4. Designing for Rework
(Appendix B) | M. Brown, TRW Defense and Space
Systems |
| 5. Validation of Repair
Techniques (Appendix C) | J. T. Strohmer, National Security
Agency |
| 6. Repair and Rework of New
Printed Circuit Assemblies
(Appendix D) | J. T. Strohner, National Security
Agency |
| 7. Printed Wiring Board
Problems, UHF Receiver
Subsystem (Appendix E) | T. Long and H. Snyder, ECI

OUTLINE

- INTRODUCTION
- REWORK AND REPAIR - DEFINITIONS
- NONCONFORMING ITEM REPROCESSING
 - REWORK
 - REPAIR
- RECAP

REWORK AND REPAIR - DEFINITIONS

- REWORK

A PROCESS THAT RESTORES ALL NONCONFORMING CHARACTERISTICS (OF A NONCONFORMING ITEM) TO THE SPECIFICATION REQUIREMENTS.

- REPAIR

A PROCESS DESIGNED TO REDUCE BUT NOT COMPLETELY ELIMINATE THE NONCONFORMANCE.

REWORK AND REPAIR - DEFINITIONS (CONTINUED)

• IPC-I-50A

REWORK

THE ACT OF REPEATING ONE OR MORE MANUFACTURING OPERATIONS FOR THE PURPOSE OF IMPROVING THE YIELD OF ACCEPTABLE PARTS.

REPAIR

THE ACT OF RESTORING THE FUNCTIONAL CAPABILITY OF A DEFECTIVE PART WITHOUT NECESSARILY RESTORING APPEARANCE, INTERCHANGEABILITY, AND UNIFORMITY.

REWORK AND REPAIR - DEFINITIONS (CONTINUED)

- NHB 5300.4(CIR)

REWORK

THE CONTINUATION OF PROCESSING ARTICLES AND MATERIALS THAT WILL MAKE THEM CONFORM TO DRAWINGS, SPECIFICATIONS, PROCEDURES, OR CONTRACT.

REPAIR

OPERATIONS PERFORMED ON NONCONFORMING ARTICLE TO PLACE IT IN USABLE AND ACCEPTABLE CONDITION.

REWORK AND REPAIR - DEFINITIONS

- MILITARY STANDARD 1520A

REWORKED MATERIAL

MATERIAL THAT WAS NONCONFORMING BUT HAS BEEN SUBJECTED TO A PROCESS THAT RESTORES ALL NONCONFORMING CHARACTERISTICS TO THE REQUIREMENTS IN THE CONTRACT, SPECIFICATION, DRAWING OR OTHER APPROVED PRODUCT DESCRIPTION.

REPAIRED MATERIAL

NONCONFORMING MATERIAL PRESENTED BY THE CONTRACTOR TO THE GOVERNMENT FOR ACCEPTANCE AFTER IT HAS BEEN SUBJECTED TO A PROCESS DESIGNED TO REDUCE BUT NOT COMPLETELY ELIMINATE THE NONCONFORMANCE.

DESIGNING FOR REWORK

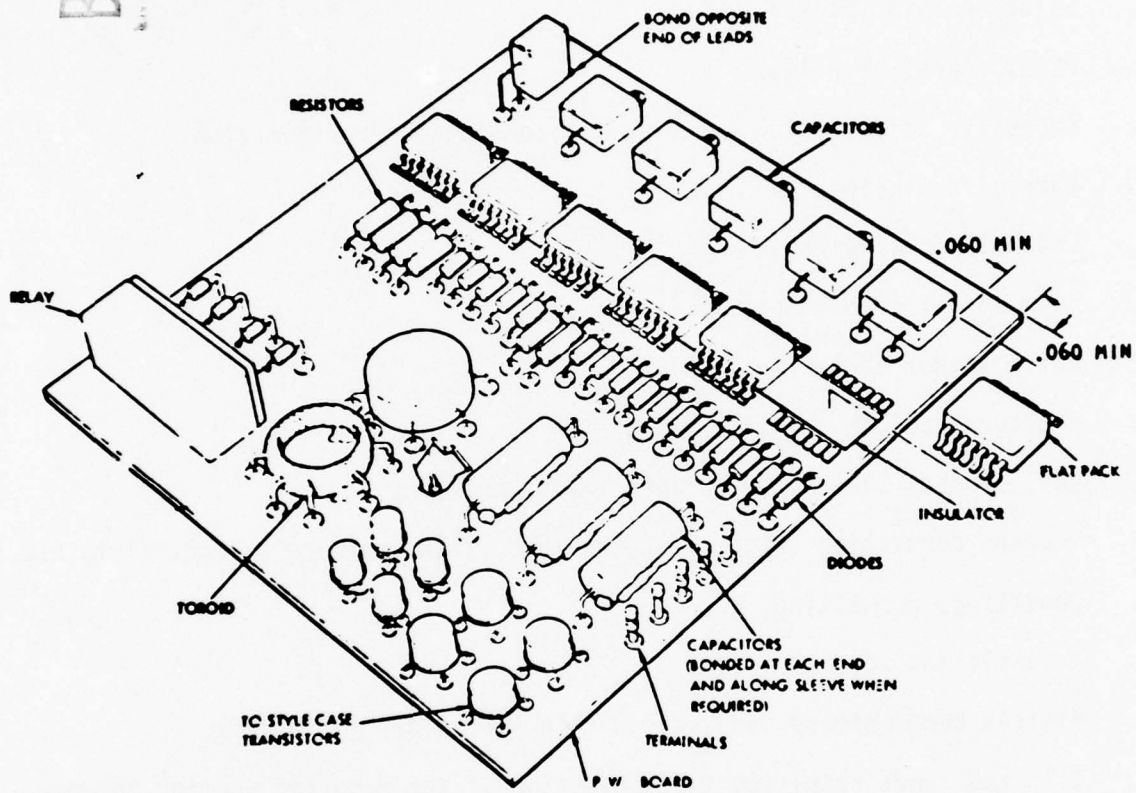

M. Brown
TRW Defense and Space Systems

Rejection criteria. Evidence of any defects, including but not limited to the following, shall be cause for rejection.

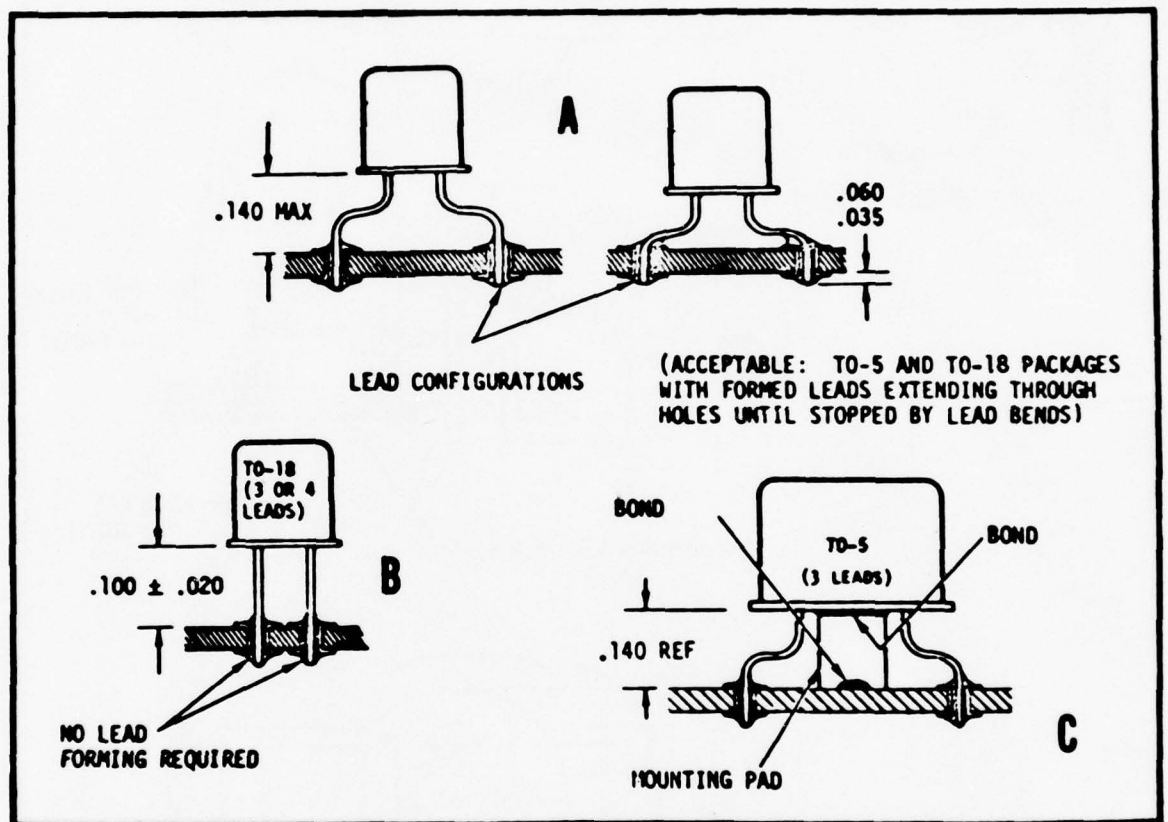

- a. Charring, burning, or other damage to insulation.
- b. Splattering of flux or solder on adjacent connections or components.
- c. Solder points (peaks).
- d. Pits, scars, or holes.
- e. Excessive solder which obscures the connection configuration.
- f. Excessive wicking.
- g. Loose leads or wires.
- h. Cold solder connections.
- i. Rosin solder connection.
- j. Fractured solder connection.
- k. Cut, nicked, stretched, scraped leads, or wires.
- l. Unclean connection (e.g., lint, residue, flux, solder, splash, dirt, etc.).
- m. Dewetting, nonwetting.
- n. Insufficient solder.
- o. Visible bare primary conductor within the solder joint area.
- p. Clinched leads resulting in a reduction of the required spacing between conductors.
- q. Splicing.
- r. Plated through holes not filled with continuous solder plug.

Rework. Soldered joints reworked to correct deficiencies shall be one hundred percent reinspected for deficiencies in question and for any other features that may have been affected by the reworking operation.

DRAFT

This brief paper is to share with you the results of the first Institute of Printed Circuits (IPC) Round Robin Repair Test Program. I intend to only highlight the study, the complete study has been reported by Ralph Hersey, Lawrence Livermore Laboratories, the Chairman of the IPC Task Group for this project. My Agency and Collins Radio Group were the testing elements. It is my understanding the IPC will validate all repair techniques that appear in IPC-R-700 Modification and Repair Procedures for Printed Wiring.

The stated objectives of this study were:

- PROVIDE VALIDATION: To provide test data on the relative ability of selected repair methods to withstand specified environmental testing.
- COMPARE METHODS: To provide comparative test data on similar repair methods subjected to the same test environments.
- COMPARE SKILL LEVELS: To provide data on repairs performed by two groups of average capability personnel, with each repair group performing at different levels of repair skill.
- ORIGINATE METHODS: To provide examples of how to originate a repair method based upon individual repair requirements.
- ENVIRONMENTAL SURVIVAL: To provide a guideline on how one can environmentally test repair techniques.

The repair methods selected for this, the first study program, were damaged conductors, solder bridging; damaged conductors, solid jumper wire on surfaces; damaged conductors, metal foil jumper on surface; damaged conductors, jumper wire through boards; and pad/conductor pattern delaminated and missing.

In order to learn more about the degree of difficulty and effectiveness of the repair techniques, two levels of personnel skill were selected. One group had no previous modification or repair experience, only the ability to use basic tools and to perform simple soldering operations. The other group had considerable specialized training and experience.

The test specimens were identical boards having three networks, each of which had specific design parameters. The circuits were designed to permit initial and final electrical interconnection resistance testing. The specific defects outlined above were intentionally created in an identical manner on each test specimen board. Repairs were made by both levels of personnel and the specimens were coded and shipped to our Agency and Collins Radio Group for testing.

After the electrical tests were performed the following environmental and subsequent electrical tests were also performed:

MECHANICAL SHOCK

MIL-STD-202, Method 213, Test Condition J, 30g's, 11 ms, half-sine. Three shocks along each of the three mutually perpendicular axis (total 18 shocks). Electrical continuity was monitored by one tester during mechanical shock testing.

VIBRATION (Non-Resonant)

IPC-TMM-650, Method 2.6.9

One sweep from 20 to 2000 to 20 Hz performed in 16 minutes. The input acceleration (g's) over the 20 to 2000 to 20 Hz frequency range shall be 15 g's. Electrical continuity was monitored by one tester during mechanical vibration testing.

THERMAL CYCLING

IPC-TMM-650, Method 2.6.6, Class A Modified

The thermal cycle had the following profile:

<u>STEP</u>	<u>TEMPERATURE</u>	<u>TIME (Min)</u>
1	+5 100 -0	45
2	+25 <u>±</u> 5	15 max.
3	+0 -60 -5	45
4	+25 <u>±</u> 5	15 max.

RESULTS:

The quality of the repairs was directly related to the skilled and unskilled personnel. In fact, numerous failures were detected on the initial electrical resistance test of specimens prepared by unskilled personnel. After these failures were corrected by skilled personnel, no further failures occurred. It is also interesting to note the specimens that failed initially were obviously not electrically tested prior to shipment.

I have attempted to briefly describe this test program and I strongly suggest the reader obtain a copy of the formal IPC report on this subject.

D-1

DRAFT

This is a brief presentation to discuss some of the Department of Defense (DoD) experiences related to repairing new printed wiring assemblies at the manufacturing plant. Because of the expense involved in scrapping and replacement, it is obvious that one must allow sensible (and proven) repair procedures in order to meet delivery requirements and to avoid wasting money. My experience stems from the engineering department which oversees the production programs for modern sophisticated electronic equipments. We establish the requests for printed circuits at the R/D level, monitor production, and service equipment programs through their entire life cycle.

In order to set the tone for other speakers at this seminar, I have selected the following topics to speak briefly and entertain any questions:

BLISTERED MULTILAYER BOARDS
LIFTED CONDUCTOR PATH
MISSING OR DAMAGED CONDUCTOR
MEASLES ON PRINTED WIRING ASSEMBLIES
PAD SPIN-OUT
MEALING

Regardless of the type of repair being made, it is of the utmost importance to have qualified personnel for the repair, rework, or touch-up. Acceptable repairs rework or solder touch-up depends on the training, competence, skill, and experience of the person performing the operation.

The basic criteria for all repairs is that the assembly meets the original design requirements.

BLISTERS ON MULTILAYER PWBs:

One vendor had a problem of air entrapment in 15 layer boards. Investigation revealed a rapid heat build-up in the laminated press caused gelation of resin prior to full flow-out of air. Blisters of 1/4-inch in diameter or less, and in an unpopulated area of the boards were accepted. Blisters 1/4 to 3/4-inch were drilled at each end of the blister; baked for 2-hours at 250°F and injected with epoxy using a hypodermic needle, placed in a vacuum system to drain out air. They were then cured at ambient conditions. Cost of these boards was approximately \$1000.00 each. There were over 150 boards involved.

LIFTED CONDUCTOR PATH:

To repair lifted conductor patterns, we removed conformal coating with fiberglass eraser cleaned area with solvent (chloroethene NU) using soft brushes and low pressure air. We pressed the lifted conductor patterns down on the board with a smooth wooden probe. Pre-heating the assembly in an oven for 1-hour at 110°C, is important. It was necessary to mix the epoxy adhesive (FYIAC 501H-A, PN50-700015-4, and 501 H-B, PN50 700017-2) remove pre-heated assembly and apply adhesive within 3-minutes after removal from oven. Using a hypodermic syringe one can apply a fillet of adhesive along one edge of the repair area and tilt to allow adhesive to flow under the repair area. Place the board horizontal and apply a thin coating over the area, then apply a fillet of adhesive along each edge of the conductor. Curing in oven at 110°C for 16-hours is also necessary.

MISSING OR DAMAGED CONDUCTOR: (In solder joint area)

Complete breaks, scratches, nicks, or pin holes which reduce the cross-sectional area of the conductor may be considered for repair. No more than two repairs should be allowed on each assembly. And, only one per individual conductor

pattern. Conductor patterns stripped from scrap boards may be salvaged and soldered to the damaged board. Circuit should be a lap joint and be bonded to the board with an adhesive. The same preparation and procedures as described in lifted conductor may be employed.

MEASLES ON PRINTED WIRING ASSEMBLIES:

Where small fractures have occurred between the epoxy resin and the fiberglass filler, repairs may be allowed but only on the outer layer of the board and not closer than 1/4-inch from the edge. Remove measled area with a scalpel or xacto-knife and brush away all loose resin or fiberglass. Heat board 220°F - 240°F (104-116°C) for 1-hour. Immediately upon removal from oven fill area, to be repaired with epoxy resin. Cure at 212°F for one hour (100-105°C). EPON 815 resin and DTA curing agent (dielhytenetriamine) is excellent for this type of repair.

PAD SPIN-OUT:

Thin line conductor, small hole to pad diameter ratio, and close spacing are taxing the state of the arts. The problem of pads breaking adhesion and spinning out during drilling is appearing more frequently. Although there are no repairs for this problem, redesign by so forming octogonal, square, or rectangular pads can eliminate the problem on future production. Pads with corners (as opposed to circular offer a tremendous resistance to spin-out.)

MEALING:

Mealing is the separation of the conformal coating from the surface of the board. When viewed at high magnification, white spots appear as a result of light reflection of the lifted portion of the coating. This occurs as a result of contami-

nant on the board surface and is pronounced when exposed to temperature, humidity environments.

The paractical way to eliminate mealing is to optimize the cleaning procedure to assure effective removal of foreign residue from the board surface. A suggested guideline is enclosed as Appendix I.

I would like to summarize by adding there are many other useful documents to be used as sources for either specific repair procedures, or acceptance limits after a repair.

NASA HANDBOOK NHB 5300.4 SOLDERING REQUIREMENTS

DRAFT

GUIDELINE PRINTED CIRCUIT BOARD ASSEMBLY CLEANING PROCEDURE

This procedure was established in mid 1972 by consolidating procedures from many contractor sources; by creating a composite procedure; and by testing; by using it on production programs and modifying as necessary to refine the procedure. It is offered as an excellent starting point to set-up a production line and almost certainly will require slight modification to suit the product conditions. The usual precautions such as not cleaning aluminum parts with trichloroethanes, not scrubbing components so as not to remove the date codes; proper masking; proper racking etc, are not discussed in this procedure:

- * Vapor degrease by immersion in boiling sump for 1½ minutes, raise to vapor area and spray both sides 15 seconds each, immerse in cool sump.

- * After touch-up, repeat above.

- * Mix alkaline detergent (5 to 10%) with D.I. water, starting with 5% solution. Heat to 115° to 130°F, immerse assembly and soak one minute.

- * Rinse assembly in tap or D.I. water, then soak in D.I. water for one minute.

- * Immerse assembly in Isopropyl alcohol at room temperature and soak for three minutes. During this time, period scrub both sides in all directions, except for I.C. devices.

- * Place assembly in a new bath of Isopropyl alcohol, also at room temperature; immerse rinse for 30 seconds.

D-14

DRAFT

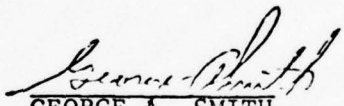

* Rinse, then soak assembly in D.I. water (200,000 ohms minimum) for one minute.

* Rack-mount assembly in drying chamber at $185^{\circ}\text{F} \pm 10$ for two hours.

* Remove assembly mask and conformal coat both sides within two hours after removal from drying chamber. If two hours is exceeded, re-dry.

* Air-dry assembly (room ambient) for 30 minutes, then place in drying chamber at $185^{\circ}\text{F} \pm 10$ for 30 minutes to post cure conformal coating. Caution - do not use the same drying chamber as used prior to conformal coating.

* Remove masking materials, cool to room temperature and place assembly in protective plastic package until further processing.

APPENDIX F
MEASLING - CAUSES AND EFFECTS

R. Douglas
TRW Defense and Space Systems

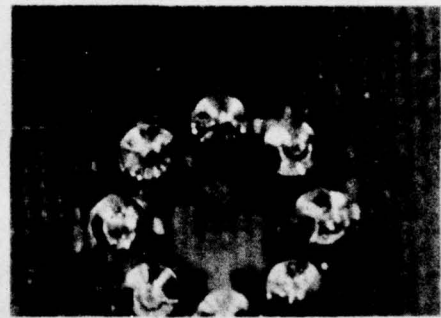

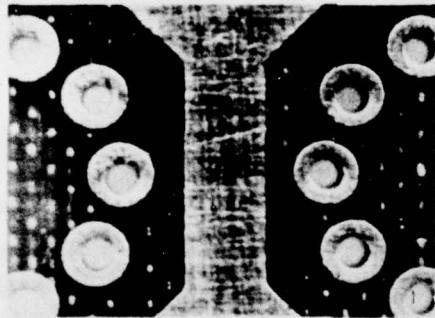

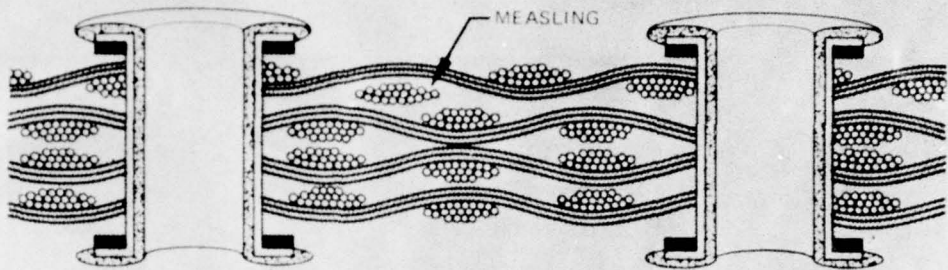

ACCEPTANCE CRITERIA FOR MEASLES

- o SHALL NOT BE CONTINUOUS BETWEEN CONDUCTIVE AREAS.
- o SHALL NOT EXTEND MORE THAN 0.031 INCHES FROM INITIAL POINT OF STRESS.
- o SHALL NOT BRIDGE MORE THAN 50% OF THE DISTANCE BETWEEN ADJACENT CONDUCTORS.
- o SHALL NOT AFFECT MORE THAN 3% OF THE TOTAL BOARD AREA.

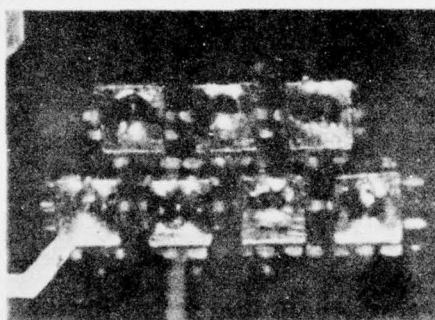

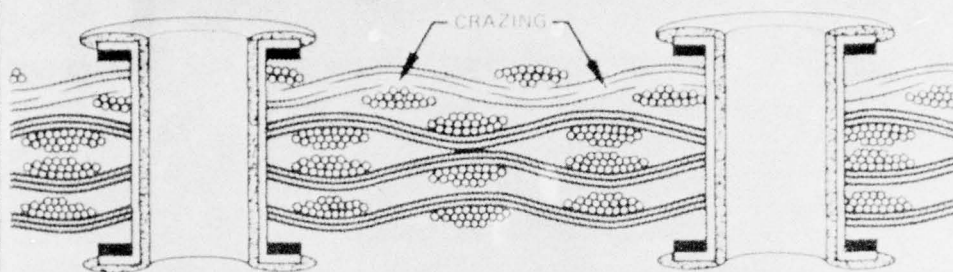

Identification of MEASLES

MEASLING — A condition existing in the base laminate in the form of *discrete* white spots or "crosses" *below* the surface of the base laminate, reflecting a separation of fibres in the glass cloth at the weave intersection.

Identification of CRAZING

CRAZING — A condition existing in the base laminate in the form of *connected* white spots or "crosses" on or below the surface of the base laminate, reflecting the separation of fibres in the glass cloth and connecting weave intersections.

ITEMS TO BE PRESENTED:

- INSPECTION PRIOR TO, DURING AND AFTER REWORK
- SEQUENTIAL REMOVAL
- COATING REMOVAL/RE-APPLICATION
- REMOVAL AND REPLACEMENT OF COMPONENTS
- ADDING TO THE CIRCUIT

INSPECTION PRIOR TO, DURING AND AFTER REMORK

● **INSPECTION PRIOR TO REMORK:**

VISUAL INSPECTION IS PERFORMED ON DISCREPANT PART OR SUBASSEMBLY PRIOR TO REMOVAL OR DISTURBING OF THE DISCREPANT HARDWARE. THE REPORTED NONCONFORMANCE WILL DICTATE THE DEGREE AND TYPE OF INSPECTION NECESSARY.

● **INSPECTION DURING REMORK**

- DUE TO THE COMPLEXITY OF THE HARDWARE BEING REMORKED, IN-PROCESS INSPECTIONS WILL BE REQUIRED FOR ANY ITEM THAT MAY BE COVERED UP AND WILL NOT BE VISIBLE AT FINAL INSPECTION. THIS IN-PROCESS INSPECTION MAY INCLUDE DCAS/CUSTOMER.

● **INSPECTION AFTER REMORK**

- INSPECTION OF REMORK MUST MEET THE CRITERIA ESTABLISHED PER FIRST PASS BUILD. ANY DEVIATION FROM PRINT AS A RESULT OF REMORK MUST HAVE PRIOR MATERIAL REVIEW BOARD APPROVAL.

- SPECIAL INSPECTION TOOLING USED IN THE SALVAGE OF COMPONENTS AND REWORK
 - 0.3X SUPPLEMENTAL SCOPE LENSE FOR FOCAL LENGTHS UP TO 14-15 INCHES (MAX POWER 10X)
 - 0.5X SUPPLEMENTAL SCOPE LENSE FOR FOCAL LENGTHS UP TO 9 INCHES (MAX POWER 15X)
 - FLEXIBLE FIBER OPTIC 7X EYELOUPE 2 FEET LENGTH
 - DERMOTRON - MEASURES THICKNESS FROM 0 TO .004 INCHES
 - IONOGRAPH - MEASURES IONIC CONTAMINATION - CLEANLINESS
 - BLACKLIGHT - FOR COATING CONTINUITY
 - RETICULES - FOR VISUAL MEASUREMENT
 - HOLE SCOPES - FOR LOOKING INTO PLATED THRU HOLES
 - COAXIAL SCOPES - FOR INSPECTION OF BLIND HOLES
 - SEM-EDAX-FOR ANALYSIS; COMPOSITION

SEQUENTIAL REMOVAL (CONDITIONS THAT CAUSE THE NEED FOR REUSING COMPONENT PARTS AND THE RATIONALE USED).

- IT IS HONEYWELL'S GENERAL POLICY TO DISALLOW THE REUSE OF COMPONENTS, HOWEVER, THERE ARE CERTAIN CONSIDERATIONS THAT WARRANT THE REUSE OF PARTS.

THEY ARE:

- CONTRACT ALLOWABLE
- SCHEDULE SLIPPAGE
- COST EFFECTIVENESS

- CONDITIONS WHERE COMPONENTS SHOULD NOT BE REUSED:

- PART LEADS IN PLATED THRU HOLES
- PARTS IN POTTED MODULES

- CONDITIONS WHERE COMPONENTS MAY BE REUSED:
 - PLANAR SOLDERED LEADS
 - TERMINAL SOLDERED LEADS
 - FLEXABLE LEAD COMPONENTS
(I.E. SLIP RINGS, TRANSFORMERS, ETC.)

SPECIAL ELECTRICAL TESTS AFTER REWORK

● SPECIAL ELECTRICAL TEST -

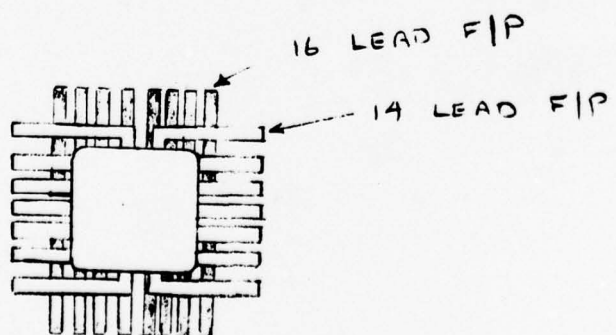

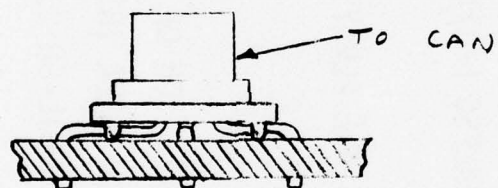

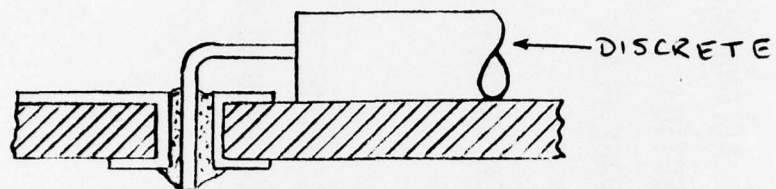

THE TYPE OF FAILURE WILL DICTATE THE NECESSARY ELECTRICAL TESTING A SUB-ASSEMBLY, ASSEMBLY, OR DEVICE MAY BE SUBJECTED TO - CONTINUITY, HI-POT ISOLATION, FUNCTIONAL TEMP CYCLING, ETC. ALL SPECIAL TESTS WILL BE DOCUMENTED IN A TEST PLAN APPROVED BY DESIGN, PRODUCTION, PROCESS QUALITY ENGINEERING, OTHER APPROVALS SUCH AS (CUSTOMER, GOVERNMENT - DEPENDS ON CONTRACT).

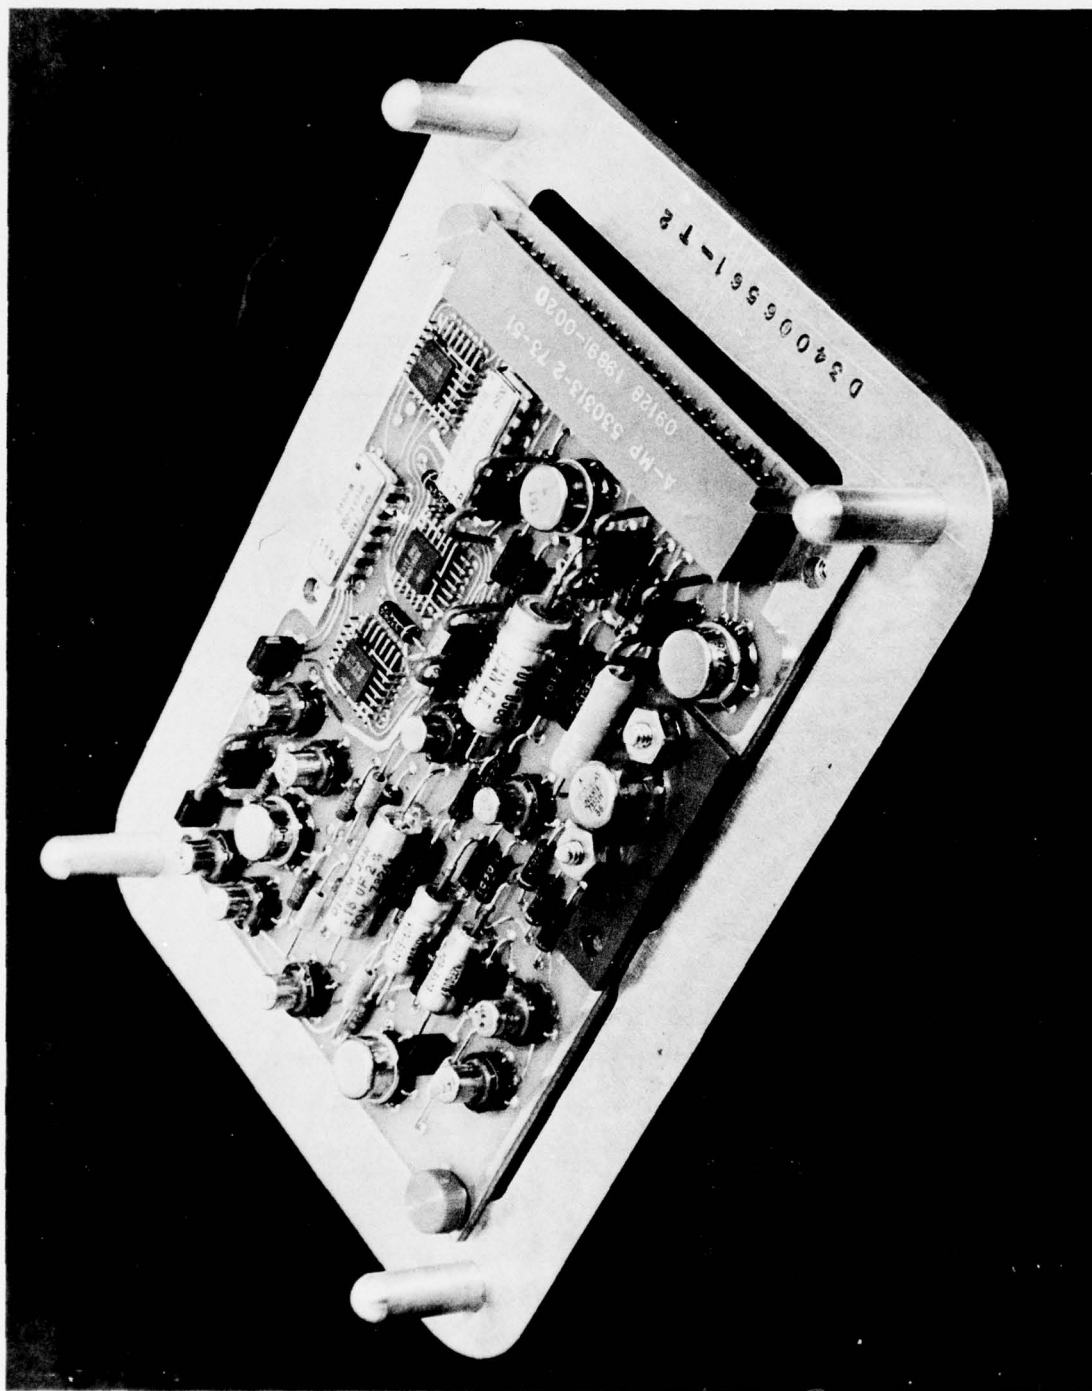

THESE SPECIAL TESTS ARE PERFORMED OR MONITORED BY PRODUCT ASSURANCE.

- REMOVING FOR TROUBLESHOOTING
 - ENTIRE PART IS NOT REMOVED
 - INDIVIDUAL LEADS MAY BE LIFTED (PLANAR TERMINAL ONLY) AND ISOLATED FOR TROUBLESHOOTING
- CRITERIA FOR LIFTING
 - ON PLANAR SOLDERED COMPONENTS 15° MAXIMUM
 - ON TERMINAL SOLDERED COMPONENTS STRESS RELIEF MUST NOT BE DISTURBED
- ALL GLASS SEALED COMPONENTS WHERE LEADS HAVE BEEN LIFTED MUST HAVE THE SEALS INSPECTED TO NASA - SR - QUAL - 66 - 21.

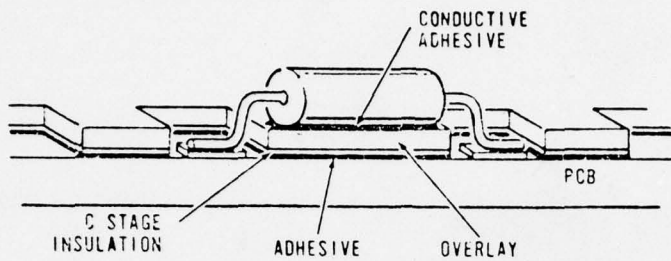

- WHAT TESTS ARE REQUIRED FOR SALVAGED PARTS?
 - ELECTRICAL TESTS ARE CONDUCTED IN ACCORDANCE WITH THE ORIGINAL RECEIVING INSPECTION CRITERIA UNLESS NOTED IN THE SALVAGE PLAN.
 - LEAK TESTS ARE ALWAYS CONDUCTED ON HERMETIC SEAL COMPONENTS.
 - VISUAL INSPECTION OF GLASS SEAL COMPONENTS ALWAYS HAS THE SEAL AREA INSPECTED TO THE REQUIREMENTS OF NASA-SR-QUAL-66-21.

REF ID	REVISION	STANDARD REWORK INSTRUCTIONS FOR	DATE	BY
171	1	Replating Axial Lead Components on Printed Wiring Boards		

TYPICAL OPERATOR REWORK INSTRUCTIONS FOR REPEITIVE TYPE OF REWORK

SCOPE:

This procedure is recommended for replating axial lead components bonded to printed wiring boards with FPS 18034, Type 4.2 Hot, and coated per FPS 18035 Type III. Components removed in this manner are not to be reused.

REQUIRED:

The A.R. Disposition shall prescribe the following as applicable:

1. Identify the P/N and location of each component to be removed and of each replacement component.
2. Disposition of removed components.
3. Special instructions such as, "Brush coat component markings with FPS 18034, Type 1.1 and cure".

REWORK INSTRUCTIONS:

1. Prepare replacement components per applicable steps below:
 - NOTE:** See PWB Assembly drawing to determine applicability.
 - *1.1 Check date of manufacture of tantalum capacitors. They must be less than two years old. If older than two years, notify P.C. Example of date code: $\frac{70}{04}$ Year Week
 - *1.2 Coat markings with FPS 18034, 1.1. Cure at $200^{\circ}\text{F} \pm 10^{\circ}\text{F}$ minimum 30 minutes.
 - 1.3 Pre-tin leads ultrasonically per SPI 01-01-01.
 - *1.4 Sleeve with shrinking tubing EMS 49509 per SPI 03-04-01. Remove vendor sleeving if present, before sleeving with shrink tubing.
2. Remove Component(s) indicated on AR Disposition.
 - 2.1 Remove any coating from the components to be removed and from the associated solder joints. Use the PACE SODIR-X-TRACTOR in the "Hot Jet Mode" to soften the coating per SPI 20-01-01, para. 4.3. Remove softened coating with a plastic or wooden tool such as an orange stick.
 - 2.2 Reflow the component leadwire solder joints and remove excess solder. Use the PACE SODIR-X-TRACTOR per SPI 20-01-01, para. 4.1. Melt the solder and apply MAX VACUUM suddenly.
- 3.1 Flow off excess alcohol from both sides of board with filtered air or dry nitrogen at 30-35 psig pressure.
- 3.2 Oven dry at $150^{\circ}\text{F} \pm 10^{\circ}\text{F}$ one hour minimum.
- 3.3 Inspection to examine reworked area for damage.
- 6.1 Coat rework area with brush or spray per SPI 17-01-01.
 - 6.2.1 Mix FPS 18035 Type III coating material per SPI 17-01-01. Note: Use less thinner for brush application.
 - 6.2.2 Preheat reworked PWB at $150^{\circ}\text{F} \pm 10^{\circ}\text{F}$ for 30 minutes minimum.
 - 6.2.3 Cool PWB to 100°F to 120°F , coat immediately.
 - 6.2.4 Apply coating to reworked area with soft brush or spray.
 - 6.2.5 Air dry at room temperature in drying cabinet for 1 1/2 to 2 1/2 hours. Place in horizontal position in oven at $150^{\circ}\text{F} \pm 10^{\circ}\text{F}$.
- 2.5 Conformal coating - Must cover reworked area(s). Coating must be free from foreign material inclusions that provide a continuous path from the surface of the coating to the circuitry. Sub-surface inclusions which bridge circuitry. Pin-holes which are open to the atmosphere. Surface tackiness.
- 2.6 Areas designated on PWB Assembly Drawing shall be free of coating.
3. Verify that packaging is per SPI 50-01-02.

TYPICAL STATEMENT ON AUTHORITY:
 The A.R. Disposition shall prescribe the following as applicable: **REPLACE THE PER SPI 06-03-01.**

COATING AND CEMENT REMOVAL

COATING -

Possibilities -

Solvent - Xylene, Trichloroethane, Methylene Chloride

Peeling - Acceptable for RTV's (Pre-Soaking with Freon TF)

Thermal Parting - Thick Coatings.

Abraision - Rubberized
Portion of thick coatings

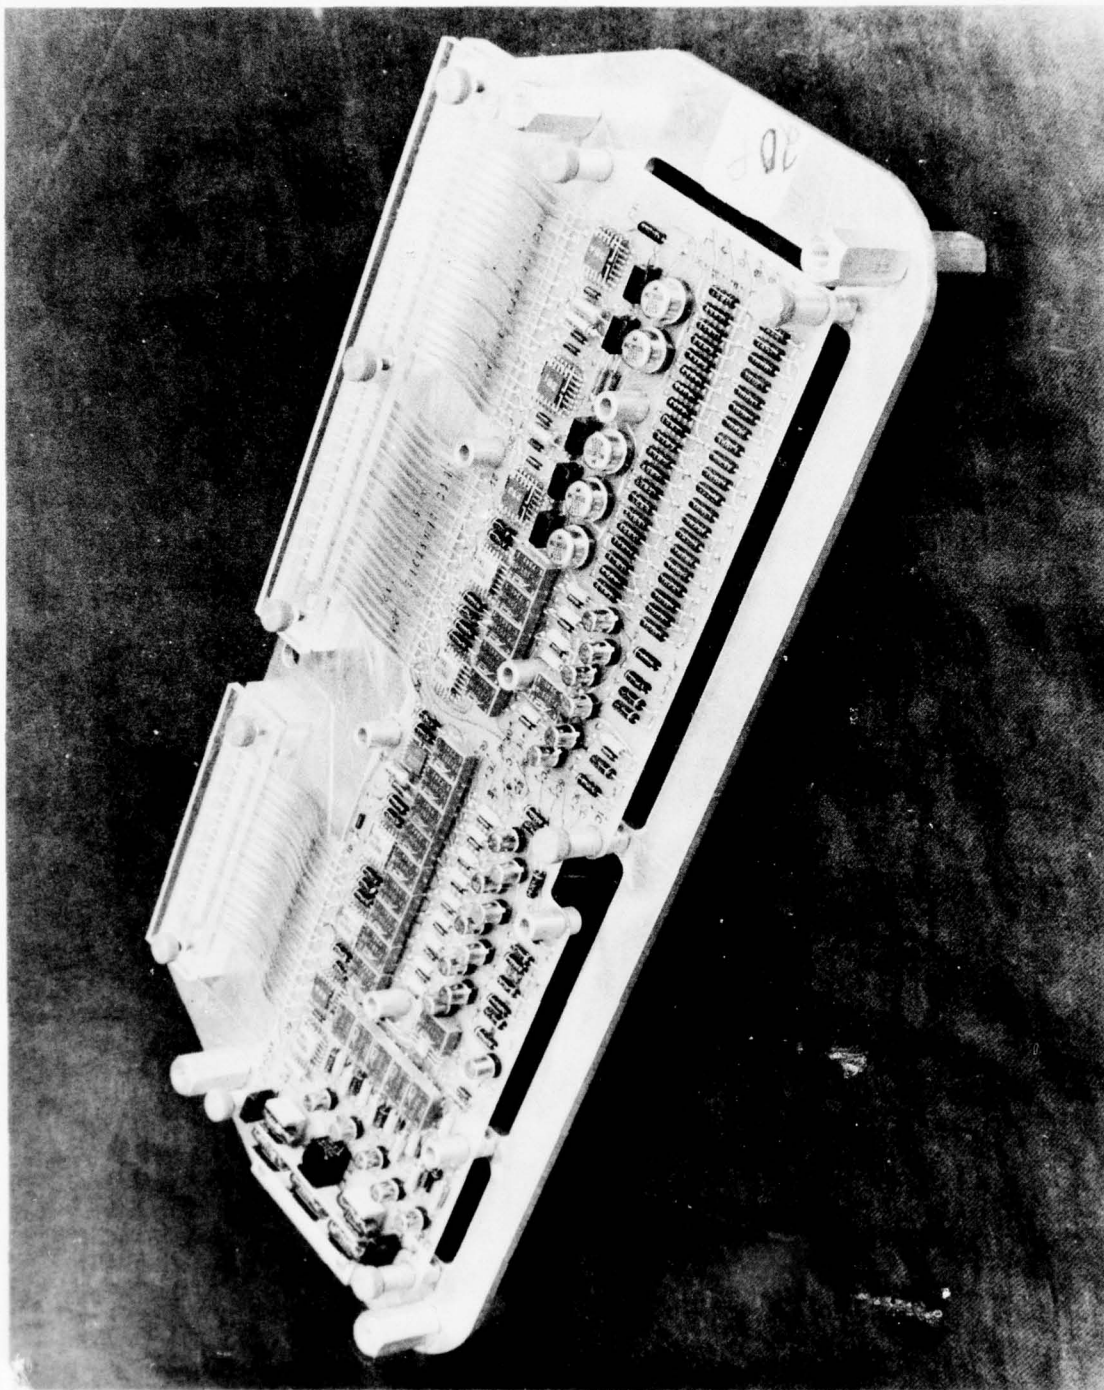

Hot Jet - Soften & Decompose

Desion Criteria

Type of Coating
Condition of the Coating
Nature of the P.C. Board parts.

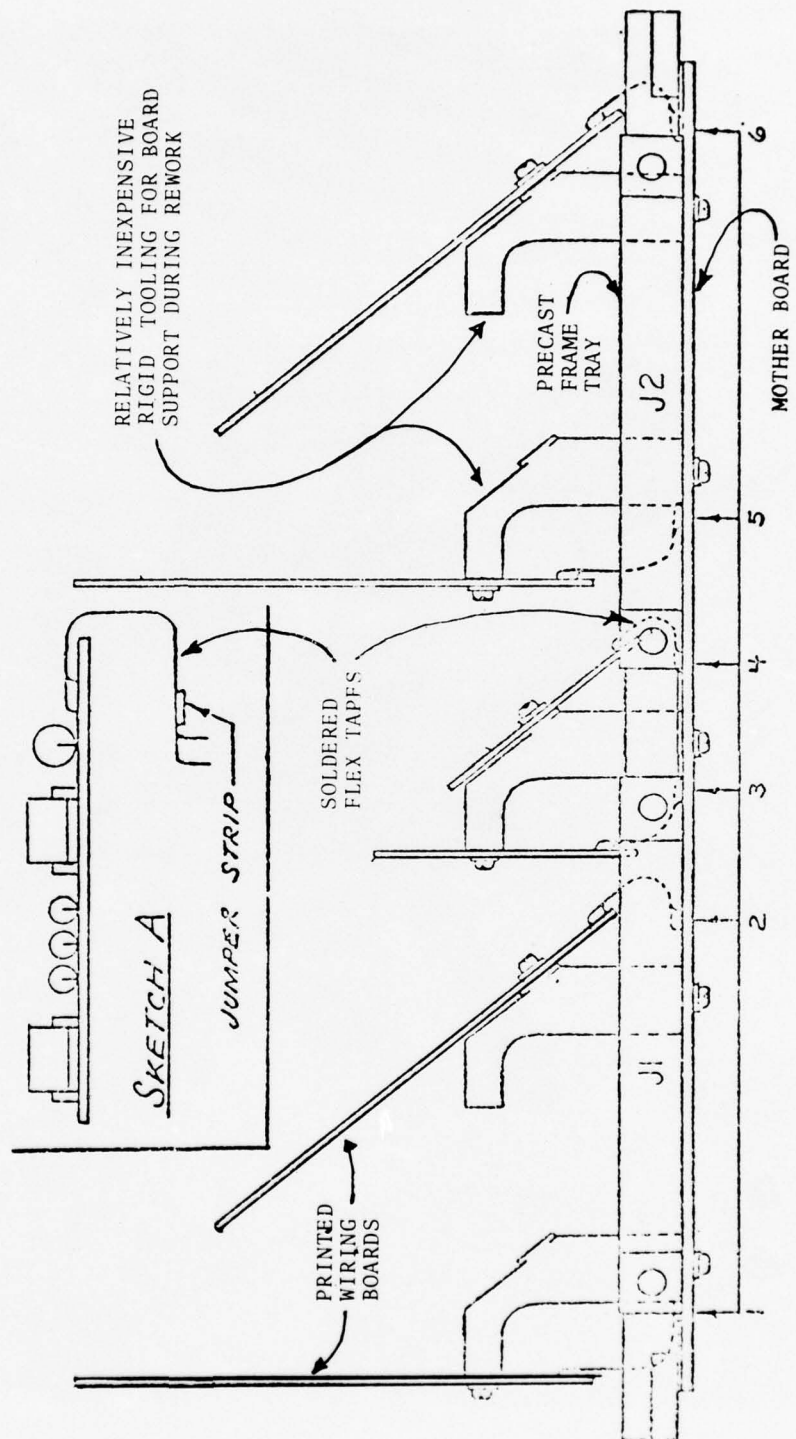

CEMENT

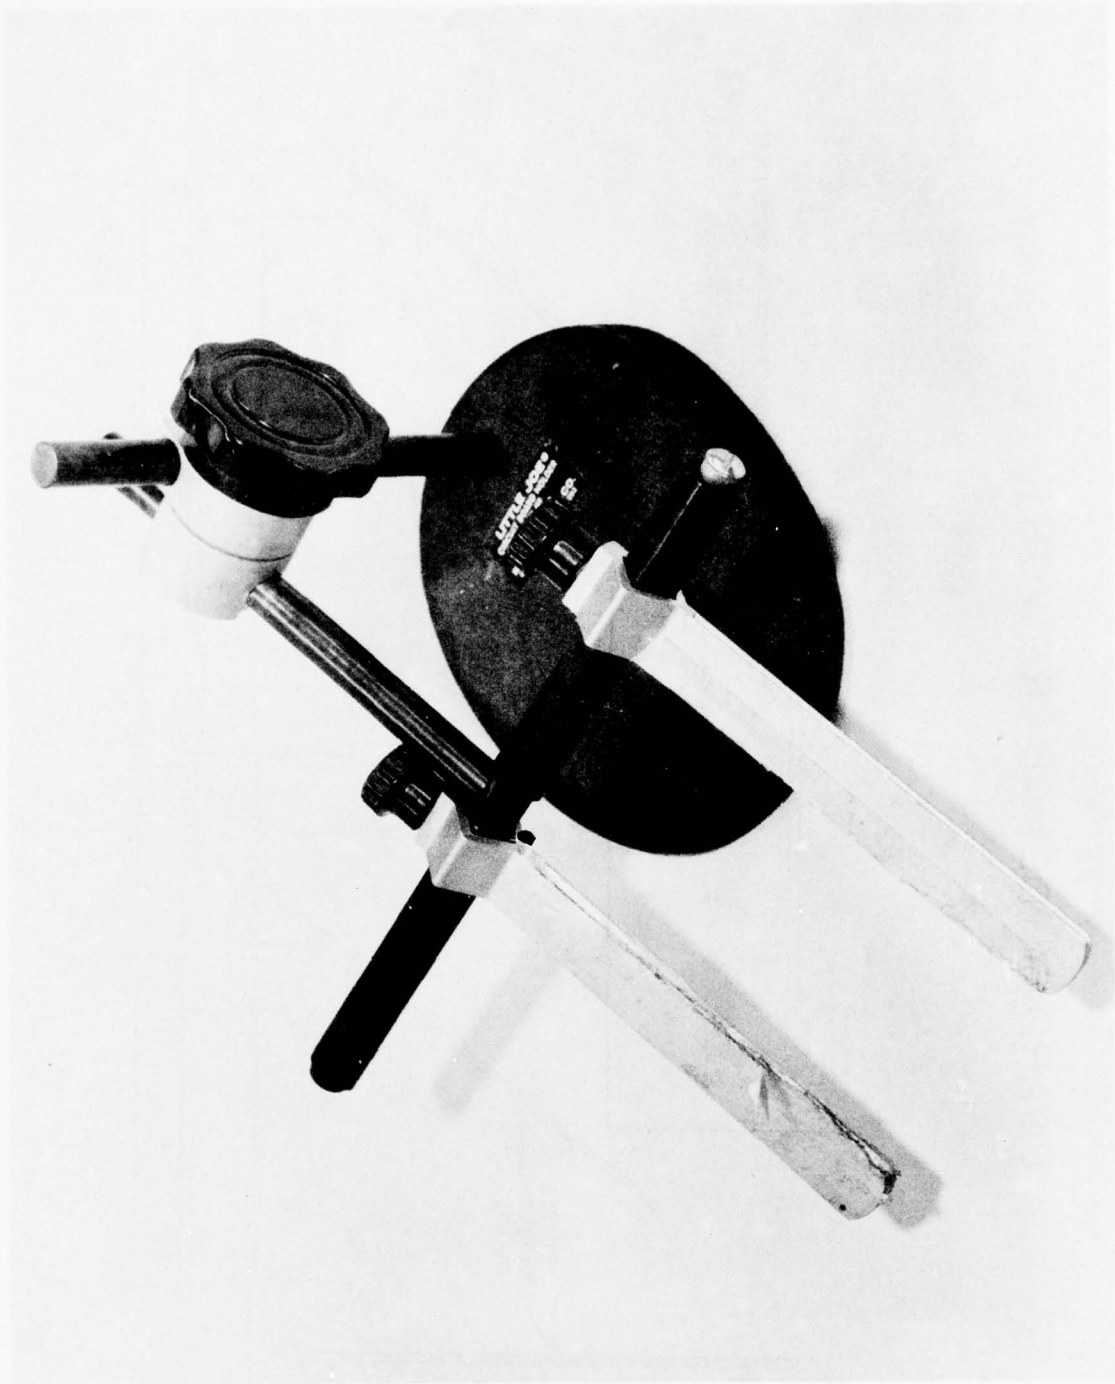

Same as above.

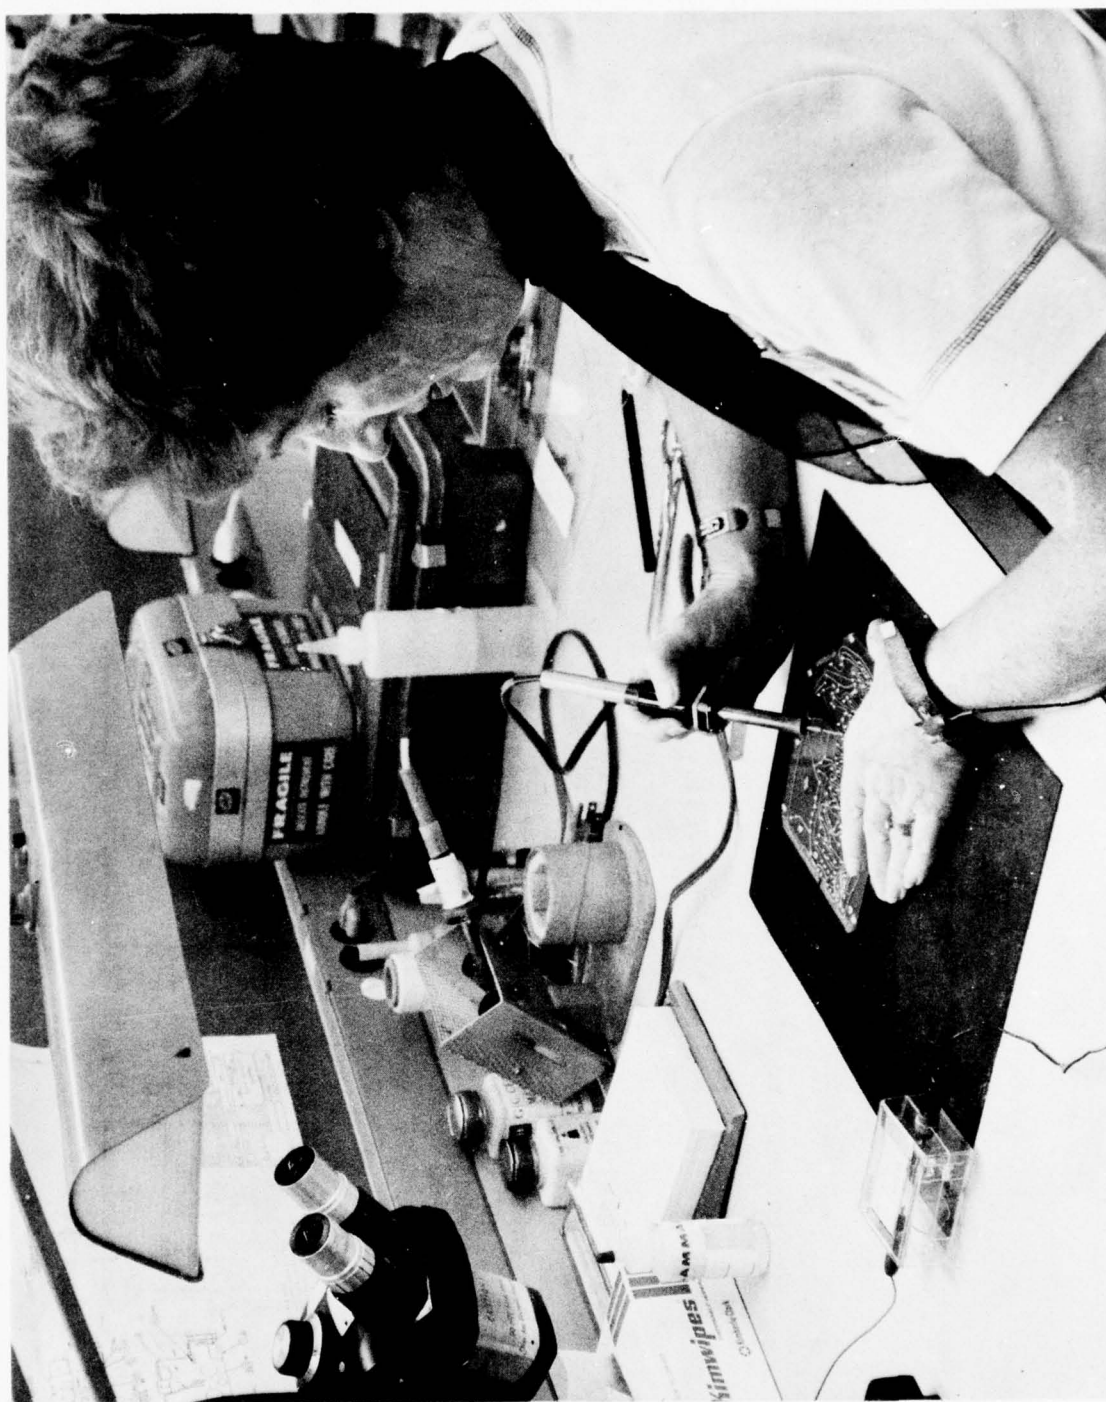

G-24

BOARD IN-DEVICE REWORK

G-26

SOLDER JOINT REWORK METHODS

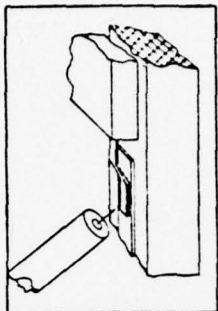

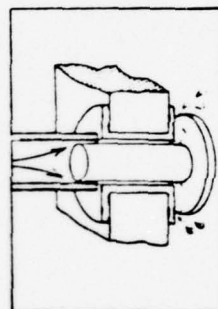

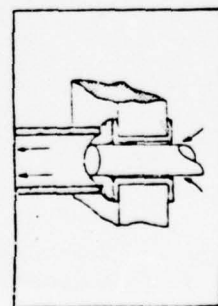

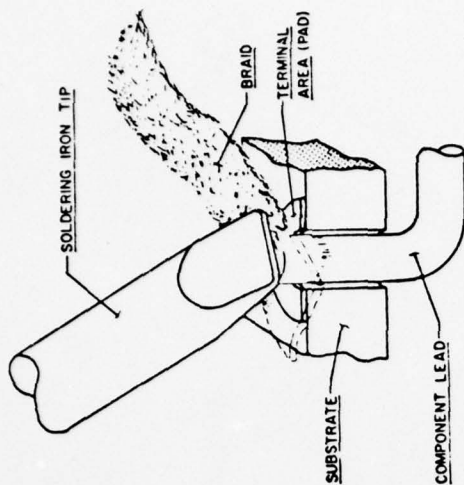

WICKING - Flux saturated stranded copper braid.
 Capillary action overcomes surface tension.
 Satisfactory for surface joints.
 Tendency to stay on joint too long.

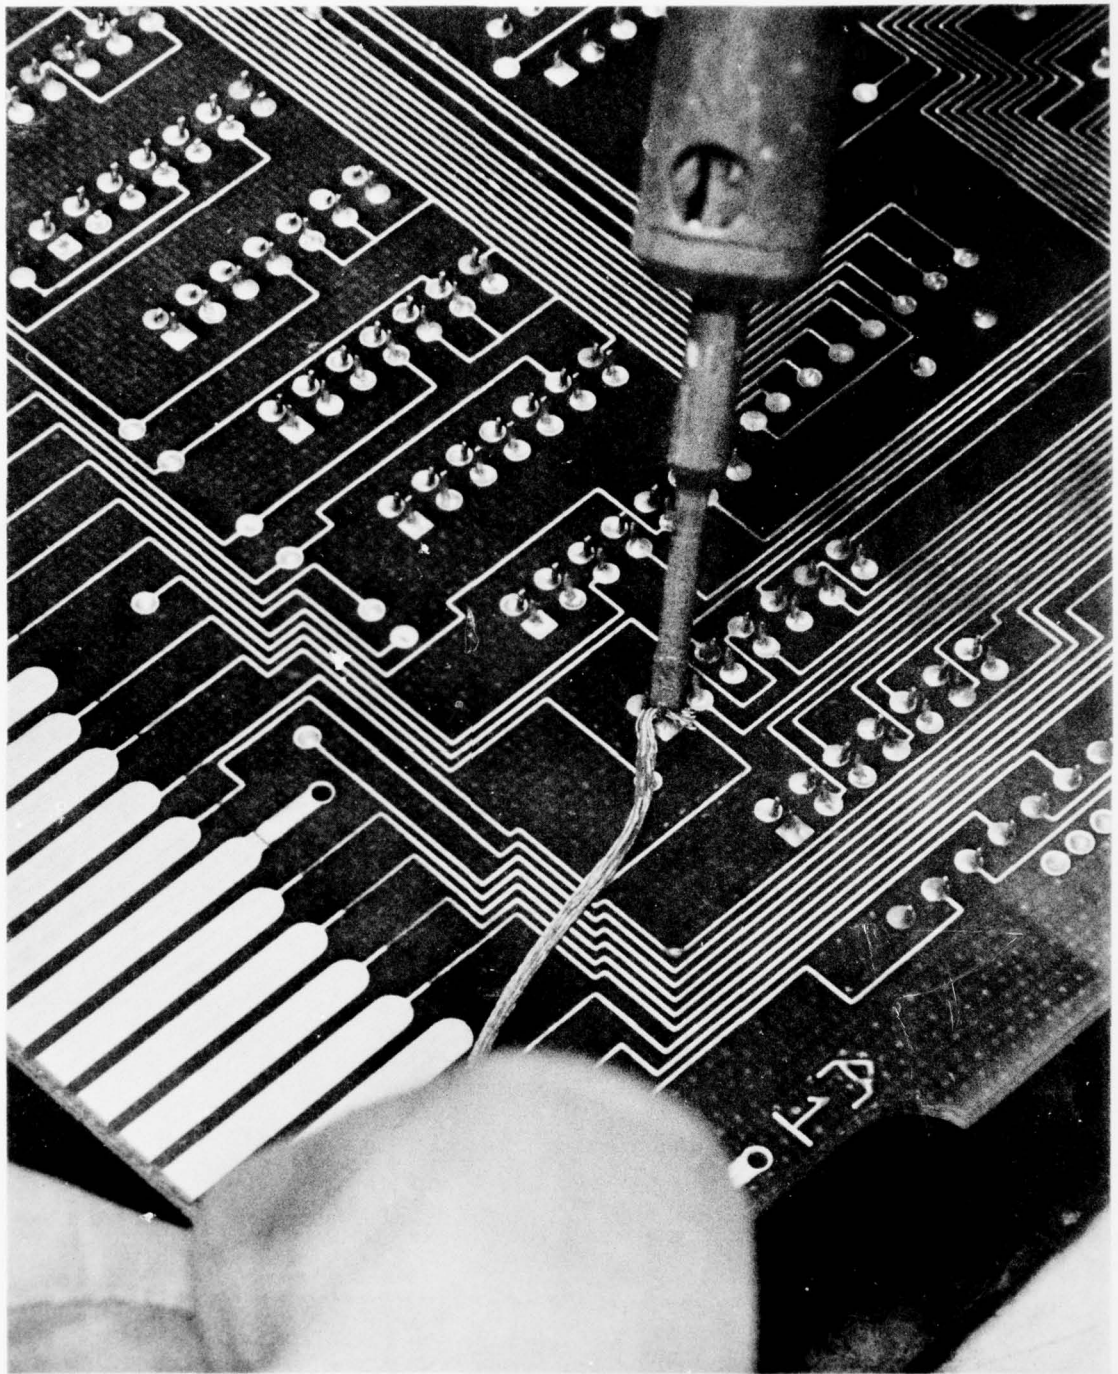

SOLDER SUCKER - Not used by Honeywell.

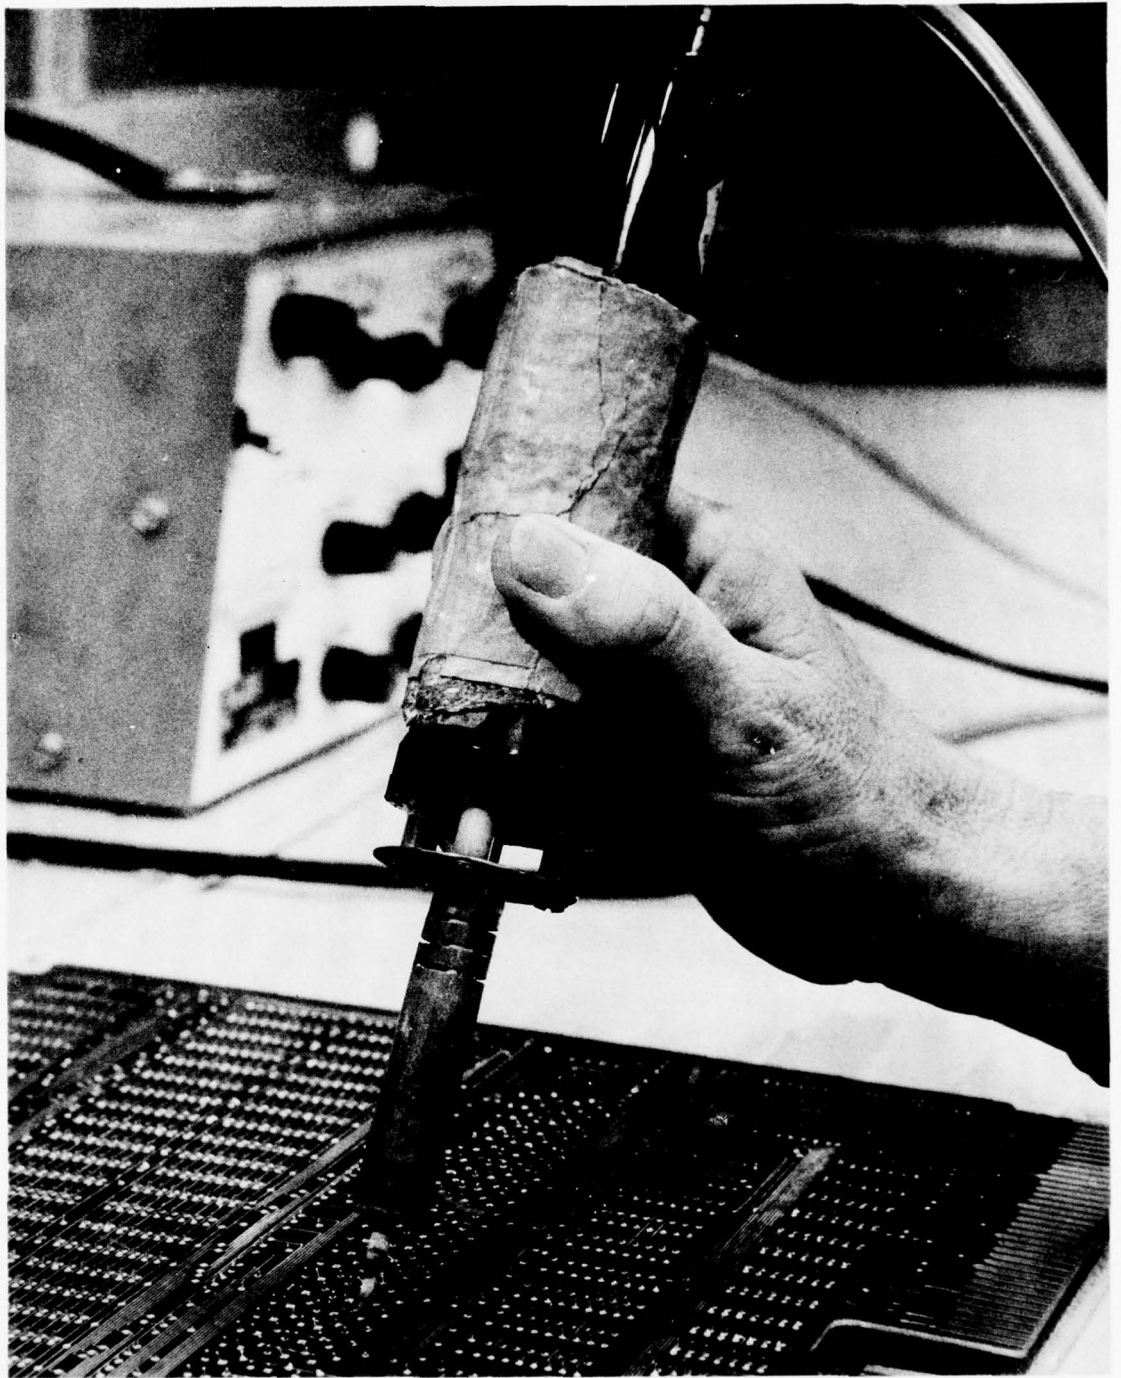

Gang Heating Devices - Not used by Honeywell.

Radiant or Infrared Pre-Heating - Special P.C. Boards.

Solder Extraction - PACE Rework Machine
 Controlled Heat, Vacuum, Pressure.

G-31

PACE TIP TYPES			
	<u>USAGE</u>	<u>COST</u>	<u>CHARACTERISTICS</u>
PLATED COPPER		<\$1.00	Max. heating capability Min. potential for pad damage Easily modified.
PLATED ALLOY	10 x Copper	1.3x	Good heating capability Easily modified More practical for continuous work.
PLATED LINED	20 x Copper	1.8x	Lowest heating capability Lining can cut copper pads Special training required.

CIRCUIT MODIFICATION OR REPAIR

APPENDIX H
POLYURETHANE COATINGS

W. Lang and K. Weeks
Space Systems Division
Lockhead Missiles and Space Company

ELECTRONIC PRINTED CIRCUIT BOARD
REWORK PRESENTATION

1. REWORK OF CIRCUIT BOARD ASSEMBLIES
2. AT OPERATION 120 DURING A MANUFACTURING TEST PROCEDURE A MALFUNCTION OCCURRED.
3. A NONCONFORMANCE REPORT WAS ISSUED AT THIS POINT LISTING THE TEST CONDITIONS AND SUBMITTED TO MATERIAL REVIEW FOR DISPOSITION.
4. DETAILED INSTRUCTIONS ON THE NONCONFORMANCE REPORT CONTINUATION PAGE VERIFIED THE FAILURE CONDITIONS.
5. PER INSTRUCTIONS GIVEN ON THE NONCONFORMANCE REPORT, A REWORK SHOP ORDER WAS PREPARED TO PLAN THE REPLACEMENT OF THE COMPONENTS. THE SHOP ORDER LISTS THE DOCUMENTATION TO BE USED FOR THE REWORK OPERATION.
6. ONCE THE REWORK OPERATIONS ARE COMPLETE, THE SUPPLEMENTAL SHOP ORDER RETURNS THE COMPONENT TO OPERATION 120 OF THE ORIGINAL SHOP ORDER FOR TESTING AND CONTINUANCE OF FURTHER WORK OPERATIONS PER THE ACCEPTANCE TEST PROCEDURE (ATP) STARTING AT PARA. 3.9.
7. NORMALLY MOST OF THE COMPONENT REMOVAL AND REPLACEMENT OCCURS PRIOR TO FILLETING AND CONFORMAL COATING. PRESENTLY A NEW EDUCATION & TRAINING PROGRAM IS BEING DEVELOPED TO PROVIDE SPECIAL TRAINING FOR THOSE OPERATORS WHO WILL BE CONCENTRATING SPECIFICALLY ON CONFORMAL COATING REMOVAL AND MODIFICATIONS OF CIRCUIT BOARDS. TYPICAL WORK INSTRUCTIONS INDEX CONSISTS OF SETP-BY-STEP WRITEUP AND PICTORIAL VIEWS. THE FOLLOWING ARE EXAMPLES OF INSTRUCTIONS FOR CERTIFIED SOLDERING PERSONNEL TO FOLLOW.

8. USE OF HEAT SINK WHEN REQUIRED
 9. ILLUSTRATIONS FOR SOLDER APPLICATION
 10. INSPECTION CRITERIA FOR SOLDER & INSPECTION
 11. CUTTING A CLINCHED LEAD
 12. AN EXAMPLE OF A SUPPLEMENT NCR AND CONTINUATION PAGE WRITTEN ON DISCREPANT PIECE PARTS FOR FURTHER ANALYSIS AND CORRECTIVE ACTION AS REQUIRED.
 13. THE PRODUCT ASSURANCE ACTION REPORT AND CONTINUATION PAGE PREPARED BY THE PRODUCT ASSESSMENT LABORATORY GIVES THE DETAIL OF THE ANALYSIS AND FINDINGS ON THE ITEM WHICH WERE SUBMITTED FOR DESTRUCTIVE PHYSICAL ANALYSIS
 14. 1) SCANNING ELECTRON MICROSCOPE PHOTOS
 15. 2) SCANNING ELECTRON MICROSCOPE PHOTOS
- XXX INTRODUCE BOB DUNAETZ, HUGHES AEROSPACE DIVISION
PARYLENE REMOVAL

KATHY WEEKS

22. CONVENTIONAL REWORK STATION
23. WORKING PER THE MWIS COMPONENTS ARE MARKED AND AN OK TO DISASSEMBLE HAS TO BE GIVEN BY INSPECTION.
NOTE:
24. HEAT GUN WARMING UP CONFORMAL COATING.

25. SHAPED ORGAN STICK REMOVING MATERIAL FROM AROUND THREE COMPONENTS ON BACK SIDE OF BOARD.
26. Q-TIP AND MEK REMOVING DENNIS LACQUER
27. METAL PROBES FOR DELICATE WORK AROUND LEADS ON FRONT SIDE OF BOARD.
28. SOLDER GOBBLER USED DRY WITH A CIRCULAR MOTION WHEN THE VACUUM IS APPLIED TO REMOVE THE SOLDER FROM LEAD AND PLATED THROUGH HOLE.
29. FLAT PACK REMOVED.
30. 32 LEAD FLAT PACK REMOVAL
31. DEVICES PLACED IN CONTAINERS TO BE DELIVERED TO M. R.
32. BOARD CLEANED READY FOR OK TO INSTALL NEW DEVICES. NEW TECHNIQUES, DEDICATED AREA AND PERSONNEL ARE BEING REVIEWED PRESENTLY FOR IMPLEMENTATION.
33. REMOVAL OF FILLET MATERIAL EPON 123/9615-62 HARDENER
34. PIECE PART.

XXX LANG RETURNS TO CONCLUDE

- (A) WHEN A REWORKED UNIT IS TRANSFERRED TO THE CONFORMAL COATING AREA THE MWIS WOULD CALL OUT MPS 403-060.
- (B) THIS OPERATION CALLS OUT FOR A MIN. OVEN DRY OF ONE HOUR AT $150^{\circ} \pm 10^{\circ}$ F TO REMOVE ANY TRACE OF SOLVENTS AFTER CLEANING.

- (C) USE MATERIALS AS CALLED OUT ON THE DRAWING.
- (D) REMOVE ASSEMBLY FROM OVEN.
- (E) COOL ASSEMBLY TO ROOM TEMPERATURE.
- (F) PREPARE MATERIAL PER APPENDIX D, PART V, TABLE D-2. THIS WILL GIVE MIX AND CURE PROCEDURE.
- (G) THE DENNIS 1162 WILL BE USED AS THE PRIMER, HAND APPLIED WITH AN ARTISTS BRUSH, CURED FOR 1/2 HOUR AT $75^{\circ} \pm 10^{\circ}$ F AND THEN OVEN CURED FOR 1 HOUR AT $150^{\circ} \pm 10^{\circ}$ F.
- (H) PREPARE SCOTCHCAST 221 (POLYURETHANE) PER STATEMENT (F).
- (I) WHEN THE DENNIS COATED UNIT IS CURED, REMOVE FROM OVEN AND IMMEDIATELY FLOW SC 211 TO THE REWORKED AREA UNTIL THE FILLED AREA MEETS THE SURROUNDING LEVEL.
- (J) CURE FOR 5 HOURS AT $75^{\circ} \pm 10^{\circ}$ F AND FOLLOW UP WITH A 1 HOUR OVEN CURE AT $150^{\circ} \pm 10^{\circ}$ F.

ADDITION OF MECHANICAL DEVICES, COMPONENTS AND JUMPER WIRES

36. PHOTO OF TURRETS, COMPONENTS, JUMPER WIRES. THE ASSEMBLY SHOWN HAS TURRETS, CAPACITOR, WIRE WOUND RESISTOR AND JUMPER WIRES. THIS WAS A PRODUCT IMPROVEMENT REQUIRED TO MEET THE FINAL ACCEPTANCE TEST PROCEDURE. THE NONCONFORMANCE REPORT REQUIRED PACKAGING ENGINEERING TO PROVIDE THE LOCATIONS FOR THE TERMINALS, THE ROUTING OF AND THE BONDING OF THE WIRES TO THE MULTILAYER CIRCUIT BOARD. AT THIS POINT A MANUFACTURING WORK INSTRUCTION SUPPLEMENT

36. (CONT'D.)

WAS WRITTEN WITH THE APPROPRIATE INSPECTION POINTS. THIS IMPROVEMENT WHEN PROVEN OUT WAS DOCUMENTED BY AN ENGINEERING CHANGE ORDER FOR AN "AND UP" CONDITION WITH SPECIFIC INSTRUCTIONS FOR MOUNTING THE COMPONENTS, ROUTING THE WIRES AND TERMINATION OF THE JUMPER WIRES WITH THE LEADS OF THE INTEGRATED CIRCUIT THROUGH THE PLATED THROUGH HOLES. AT SSD ENGINEERING THERE ARE MANY SYSTEMS THAT HAVE HAD MECHANICAL DEVICES ADDED SUCH AS HEAT SINKS, STIFFENERS, TURRETS, COMPONENTS, JUMPER WIRES. THESE HAVE BEEN DOCUMENTED ON ENGINEERING DRAWINGS TESTED AND QUALIFIED AS REQUIRED.

SPACE SYSTEMS DIVISION'S CRITERIA FOR DESIGNING CIRCUIT BOARD ASSEMBLIES WITH JUMPER WIRES

1. WHEN A BLACK BOX HAS ONLY ONE BOARD THAT WOULD REQUIRE A MULTILAYER BOARD, AND IF ONLY UP TO 8 JUMPER WIRES CAN EFFECTIVELY PERFORM THE TASK, A JUMPER WIRE DESIGN WILL BE USED FOR COST EFFECTIVENESS.
2. WHEN A MULTILAYER DESIGN HAS 10 LAYERS AND A FEW JUMPER WIRES CAN AVOID ANOTHER LAYER, DESIGN ENGINEERING WILL USE JUMPER WIRES IF THE COUNT DOES NOT EXCEED 8. EXCEPTION TO THE RULE IF 10 LAYER CANNOT BE MADE ANY THICKER DUE TO SPACE ALLOCATION.
3. UNTIL A POLYAMIDE MULTILAYER PROCESS IS CERTIFIED, ALL POLYAMIDE BOARDS MAY USE UP TO 19 JUMPER WIRES IF REQUIRED.

LOCKHEED'S POSITION ON REUSING PARTS AND DEVICES ONCE REMOVED
FROM A CIRCUIT BOARD ASSEMBLY

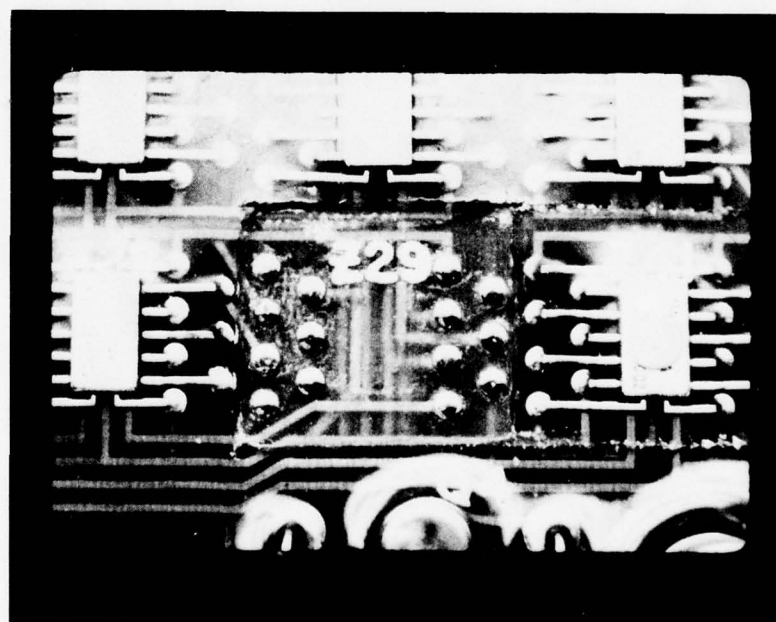

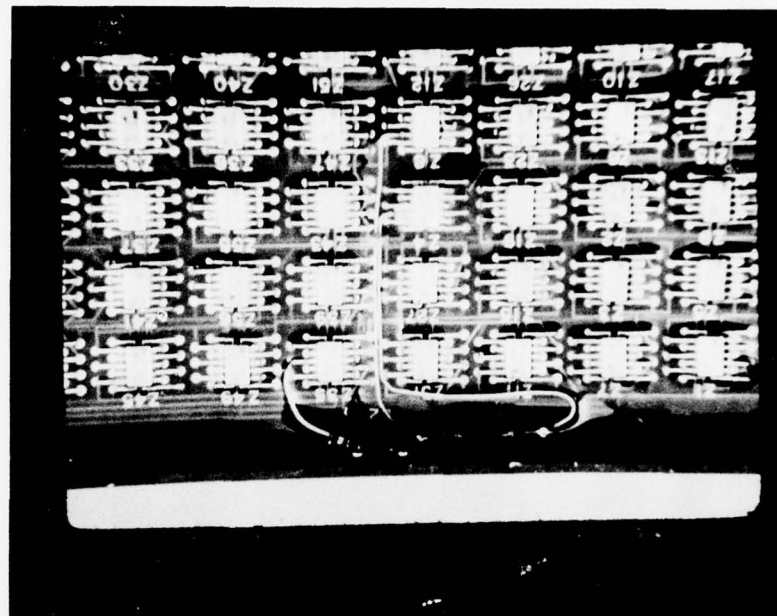

1. PARTS SUCH AS FRAMES, BRACKETS AND STIFFENERS CAN BE REUSED.
2. RELIABILITY WILL NOT PERMIT THE REUSE OF ANY ELECTRONIC DEVICE BECAUSE OF THE HI-REL REQUIREMENTS IN OUR SYSTEMS.

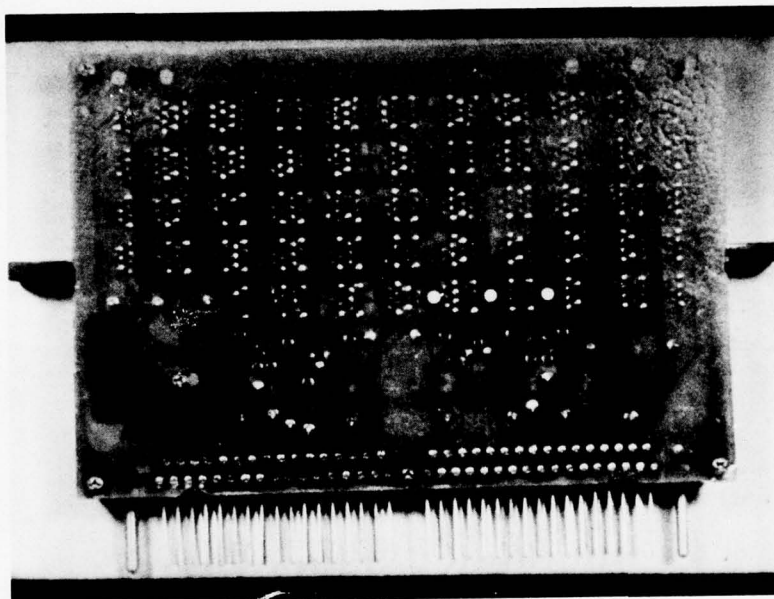

TO DATE SSD HAS HAD A SUFFICIENT SUPPLY OF SPARE DEVICES SO THAT EVEN WHEN A COMPONENT IS REMOVED FROM THE CIRCUIT DURING TROUBLE SHOOTING THAT COMPONENT IS NOT REINSTALLED BUT REPLACED. PERHAPS AS KATHY WEEKS STATED EARLIER, DEDICATED PERSONNEL AND AREAS FOR EACH PHASE OF THE REWORK COULD ALLOW A CHANGE TO TAKE PLACE. IF THAT DOES OCCUR, A MATERIAL REVIEW DISPOSITION WITH ALL THE AFFECTED GROUPS CONSENTING WOULD STILL HAVE TO BE MADE.

THIS CONCLUDES SPACE SYSTEMS DIVISION OF LOCKHEED'S PORTION OF THE PROGRAM.

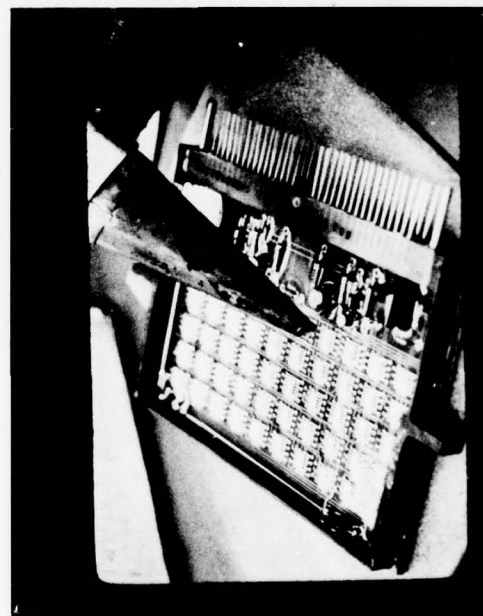

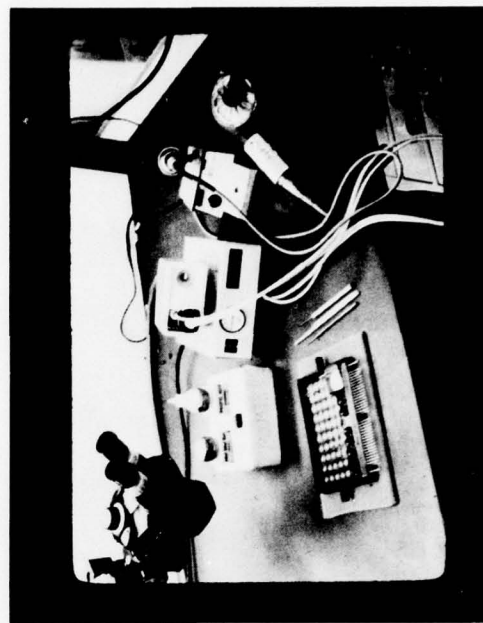

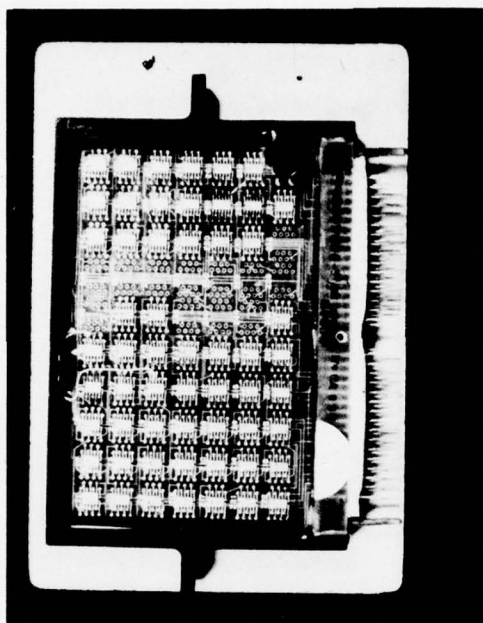

THANK YOU

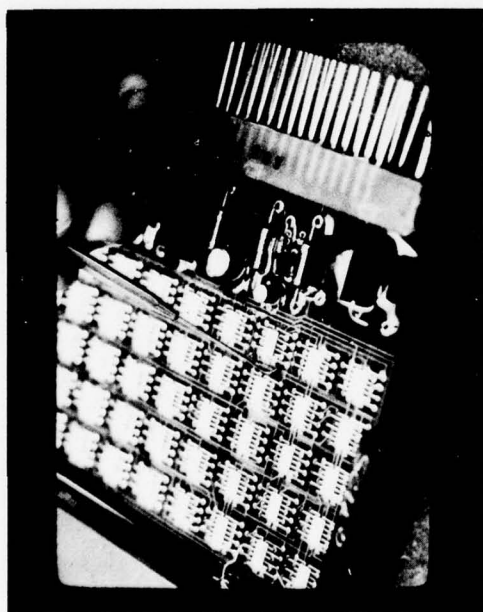

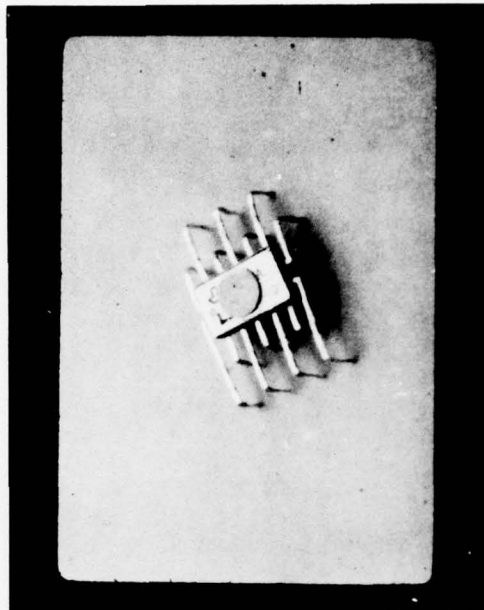

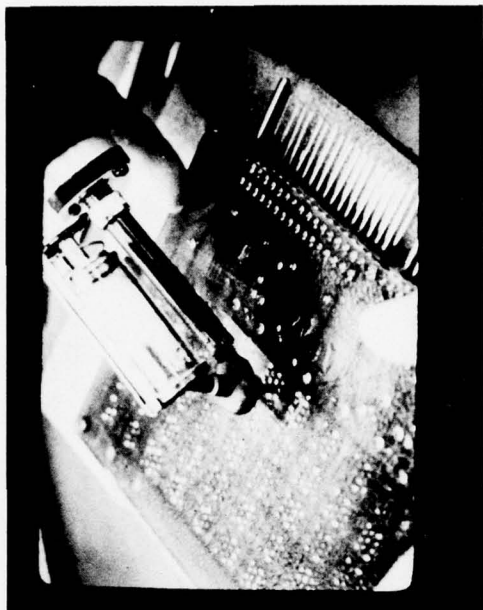

Walter A. Lang

GOVERNMENT ELECTRONICS DIVISION
SCOTTSDALE, ARIZONA

DICK KIESEL, MANAGER
PRODUCT QA SECTION

BEST AVAILABLE COPY

PERFORMING REWORK ON HI-REL
SUBASSEMBLIES ENCAPSULATED WITH
URETHANE OR SYNTACTIC FOAMS.

EQUIPMENT BUILD-UP

PRIOR TO THE FOAMING OPERATION, THE
EQUIPMENT HAS BEEN 100% INSPECTED FOR
CONFIGURATION AND WORKMANSHIP TO THE
APPLICABLE CONTRACT SPECIFICATIONS AND
TESTED ELECTRICALLY TO THE APPROVED TEST
SPECIFICATION INCLUDING THE INSTALLATION
OF ANY TEST SELECTS AND THE TUNING/ADJUSTING
OF ANY VARIABLE COMPONENTS

FOR EXAMPLE:

USE SPECIAL CONSIDERATIONS FOR VARIOUS PART TYPES:

- CERAMIC CHIP CAPACITORS
- WET SLUG TANTALUM CAPACITORS
- CERAMIC VARIABLE CAPACITORS
 - AIR VARIABLE CAPACITORS
 - GLASS VARIABLE CAPACITORS
- FIXED MICA CAPACITORS
- EMI FILTERS
 - VARIABLE RESISTORS
 - FIXED CHIP RESISTORS
 - QUARTZ CYRSTAL UNITS
 - RF CABLE ASSEMBLIES
- MAGNETIC LATCHING RELAYS
- DIODES
- TRANSISTORS
- MICROCIRCUITS

IF A PART IS BEING CONSIDERED FOR REUSE
THE FOLLOWING GENERAL GUIDELINES APPLY:

1. COMMUNICATE THE POSSIBILITY TO ALL
CONCERNED PRIOR TO REWORK SO THAT
PROPER REWORK METHOD CAN BE SELECT-
ED.
2. PERFORM MICROSCOPIC EXTERNAL VISUAL
EXAMINATION PRIOR TO REMOVING PART
AND AFTER PART IS REMOVED
3. PERFORM AMBIENT ELECTRICAL TESTS
AND COMPARE DATA WITH ORIGINAL
PARAMETER VALUES.
4. X-RAY TO EVALUATE INTERNAL INTEGRITY
(ESPECIALLY IF PART HAS INTERNAL
SOLDER JOINTS)
5. PERFORM PARTICLE IMPACT NOISE
DETECTION (PIND) TEST IF PART HAS
INTERNAL CAVITIES.
6. PERFORM FINE AND GROSS LEAK TESTS
(NOTE: REMOVE SLEEVING FROM TANTA-
LUMS).

REUSING COMPONENTS

GENERAL POLICY IS TO NOT REUSE HIGH-REL PARTS.
THERE ARE, HOWEVER, MITIGATING CIRCUMSTANCES WHICH
CAN DICTATE THAT PARTS BE CONSIDERED FOR REUSE.

E.G. REPLACEMENT PART NOT AVAILABLE
DELIVERY TIME VS. MISSION EFFECTS
SPECIAL COST CONSIDERATIONS

DECISION TO RE-USE A PART MUST BE A CONSCIENTIOUS
ONE WITH ALL AFFECTED PARTIES INVOLVED (DESIGN
ENGINEERING, PARTS ENGINEERING, QUALITY ASSURANCE
PRODUCTION, CUSTOMER AND GOVERNMENT, ETC.).

METHODS

SUMMARY

W. Lang
Space Systems Division
Lockhead Missiles and Space Company

SUMMATION OF TUESDAY'S SPEAKERS

MY THOUGHTS ON THE PRESENTATION AS GIVEN THIS AFTERNOON SEEMS TO FOLLOW THIS PATH AND I HOPE MEETS WITH YOUR THOUGHTS ALSO. THE SUMMATION WOULD BE AS FOLLOWS:

o INSPECTION

IT APPEARS THAT WE ALL HAVE EITHER A VISUAL OR ELECTRICAL TEST REJECTION CREATING THE NEED FOR REWORK. THE NONCONFORMANCE REPORT (NCR) NORMALLY DICTATES THE START OF A MATERIAL REVIEW TO DETERMINE THE APPROPRIATE STEPS TO BE TAKEN.

DUE TO THE STATUS OF THE HARDWARE, THE REWORK IN PROCESS INSPECTIONS WILL VARY. AT TIMES, IT CAN AND WOULD INCLUDE DCAS OR THE CUSTOMER TO ALLOW AN INSPECTION THAT COULD BE COVERED DURING SUBSEQUENT OPERATIONS.

THE REWORK ACCOMPLISHED HAS TO MEET THE ACCEPTANCE CRITERIA OF THE FIRST TIME BUILD. IT WILL PASS ALL VISUAL AND ELECTRICAL REQUIREMENTS. ALSO, IF THE FAILURE WAS ATTRIBUTED TO AN ELECTRONIC MALFUNCTION DURING ACCEPTANCE TEST, ADDITIONAL TESTS OVER AND ABOVE THE ACCEPTANCE TEST PROCEDURE COULD BE STIPULATED BEFORE PROCEEDING WITH THE ACCEPTANCE TEST PROCEDURE.

UNDER THE CATEGORY OF COMPONENT REMOVAL AND REUSE, IT SEEMS THAT HONEYWELL, MOTOROLA, SCI SYSTEMS AND SPACE SYSTEMS DIVISION DO NOT PERMIT THE REUSING OF REMOVED DEVICES. HOWEVER, EVERYONE CONCEDES THAT AT SOME POINT SOMEDAY, MITIGATING CIRCUMSTANCES COULD FORCE US INTO A REUSE CONDITION. WHEN THAT OCCURS, ALL PARTIES INVOLVED WITH THE SYSTEM, OR BLACK BOX, MUST AGREE ON THE REUSE. THIS AGREEMENT WOULD INCLUDE THE RESPONSIBLE ELECTRONIC ENGINEER, RELIABILITY ENGINEERING, PARTS

ENGINEERING, PRODUCTION ENGINEERING, MANUFACTURING, QUALITY ENGINEERING, THE CUSTOMER AND DCAS. THIS GROUP WOULD ALSO APPROVE THE SPECIAL REWORK INSTRUCTIONS, INSPECTION, ELECTRICAL TESTS AND THE DOCUMENTATION REQUIRED PRIOR TO REINSTALLATION. IT IS EVIDENT THAT MECHANICAL DEVICES SUCH AS BRACKETS, FRAMES, ETC., MAY BE REUSED WITHOUT ANY SERIOUS PROBLEMS.

WITH SPECIALLY TRAINED PERSONNEL, WITH DEDICATED AREAS FOR REWORK, USING THE NEWEST TECHNIQUES FOR REMOVING SOLDER WITH VACUUM SOLDER REMOVERS, AND SPECIAL TOOLING, IT APPEARS THAT REMOVAL OF COMPONENTS CAN BE ACHIEVED IN A COMPLETELY CONTROLLED MODE, WITH SPECIAL TESTS SET UP FOR THE REUSE OF ANY DEVICE AS CIRCUMSTANCES DICTATE.

THESE AREAS ARE ALSO CONDUCTIVE FOR THE MODIFICATION OF ANY ELECTRICAL SYSTEM OR BLACK BOX, DUE TO CHANGE OF SCOPE, DICTATED BY THE CUSTOMER OR PROGRAM.

IT IS APPARENT THAT ADDING TERMINALS, TRANSISTOR CLAMPS, COMPONENTS AND JUMPERS ARE BECOMING THE ACCEPTED PRACTICE FOR MEETING A CRITICAL SYSTEM DELIVERY DATE WHEN CHANGES DICTATE THEM. THIS COULD BE TO MEET THE ACCEPTANCE TEST PROCEDURE DUE TO INCIPIENT ANOMALIES WHEN THE BLACK BOX IS GOING THROUGH FINAL TEST OR A MAJOR MODIFICATION DUE TO A PROGRAM CHANGE BY THE CUSTOMER.

THE ADDITION OF JUMPER WIRES IS NOW BECOMING ACCEPTABLE, EVEN IF AESTHETICALLY IT DOES NOT MEET EVERYONE'S EYE. THIS DOESN'T DEGRADE THE HI-RELIABILITY OF THE PACKAGE BUT DOES BECOME VERY COST EFFECTIVE BY NOT HAVING TO REDESIGN AND START ANEW. THIS COST EFFECTIVENESS IS VERY IMPORTANT IN OUR NEW ENVIRONMENT OF SPENDING.

THE NEXT OBSERVATION IS ON THE REMOVAL OF FILLETING - STACKING - RUGGEDIZING AND CONFORMAL COATINGS. AS STATED UNDER THE REUSE OF COMPONENTS, EVERYONE APPEARS TO HAVE DEDICATED PERSONNEL

AND CERTAIN AREAS FOR THEIR REWORK. IT WAS RECOMMENDED THAT ADDITIONAL TRAINING AND CERTIFICATION OVER AND ABOVE THE SOLDER CERTIFICATION HAD TO BE MADE. THIS WOULD PROVIDE THE EXPERTISE NEEDED TO REMOVE THE SPECIFIC MATERIALS OF EACH COMPANY IN ORDER TO REMOVE SUCCESSFULLY ANY AND ALL COMPONENTS SO THAT THE HI-RELIABILITY OF THE BOARD, BOX OR SYSTEM WAS NOT DEGRADED WHEN REWORKED.

SOMEWHERE ALONG THE LINE I USUALLY FOLLOW THE OLD CHINESE PROVERB "PUT FOOT IN MOUTH" AND GET SOMEONE MAD AT ME -- SO HERE GOES.

WE HAVE HAD 5 SPEAKERS UP HERE THIS AFTERNOON AND EACH ONE SPOKE OF REMOVING DIFFERENT MATERIALS. AFTER ALL THESE YEARS IN THE SPACE INDUSTRY AND MANY OF THESE FINISHED BLACK BOXES RIDING SIDE BY SIDE IN THE SAME SPACE VEHICLE, WHY CAN'T WE HAVE SOME TYPE OF STANDARDIZATION.

ONE MATERIAL THAT WILL PROVIDE THE RIGID STAKING MATERIAL. ONE MATERIAL FOR THE SEMI-RIGID REQUIREMENTS. ONE CONFORMAL COATING MATERIAL THAT COULD POSSIBLY SATISFY TRANSMITTER, RECEIVER SYSTEMS AND THEN ALSO ALL THE OTHER SYSTEMS.

THE REASON FOR THIS OBSERVATION AND COMMENT TO YOU PEOPLE OUT IN THE AUDIENCE IS QUITE SELFISH. I AM THINKING OF COST REDUCTION THROUGHOUT THE AEROSPACE ELECTRONIC INDUSTRIES IN ALL PHASES OF DESIGN, PROCUREMENT, MANUFACTURING AND EVEN IN OUR OWN ORGANIZATION SUPPLIER PRODUCT CONTROL. WHEN PRODUCT ASSURANCE SUPPLIER REPRESENTATIVES ARE MOVED FROM ONE SUPPLIER TO ANOTHER, THEY WOULD NOT HAVE TO RE-EDUCATE THEMSELVES BUT USE THE SAME INSPECTION AUDIT CRITERIA. SINCE THIS WOULD EFFECT A COST SAVINGS FOR SSD, IT COULD POSSIBLY DO THE SAME FOR YOU.

THANK YOU

DEFECT: PIN HOLES OR SCRATCHES ON CONTACT TABS.

<u>CONDITION</u>	<u>CLASS OF REPAIR</u>	<u>DISPOSITION</u>
1. PIN HOLES GREATER THAN .010 DIAMETER THAT PENETRATE THROUGH THE GOLD	B	BRUSH PLATE PER SRR 5.O.3.3.
2. MORE THAN 2 PIN HOLES, LESS THAN .010 DIAMETER IN ANY ONE TAB, THAT PENETRATE THROUGH THE GOLD.	B	"
3. MORE THAN 6 PIN HOLES, LESS .010 DIAMETER PER SIDE OF BD.	B	"
4. SCRATCHES THAT ARE CONTINUOUS ACROSS THE CONTACT TAB AND PENETRATE THROUGH THE GOLD.	B	"

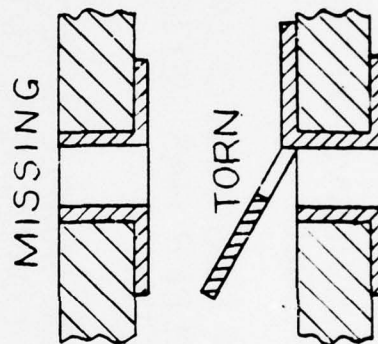

5.0.3.3.3 ACCEPTANCE CRITERIA

- a. REPAIRED AREAS SHALL BE FREE OF BURNED AREAS, BLISTERS, PINHOLES, AND OTHER VISIBLE DEFECTS, AND SHALL BE SMOOTH AND GRAIN FREE.
- b. THE PLATING SHALL BLEND INTO THE SURROUNDING AREA WITHOUT EVIDENCE OF DELAMINATION AT THE BOUNDARY AND SHALL HAVE THE SAME GENERAL APPEARANCE AS THE ORIGINAL PLATING.
- c. CHECK THE ADHESION ON EACH INDIVIDUAL REPAIR AREA BY THE FOLLOWING DRY TAPE TEST:
 1. APPLY A STRIP OF TAPE (3M #470 PLATERS TAPE) TO THE PLATED SURFACE ALLOWING A SHORT TAB TO REMAIN FREE FOR HANDLING.
 2. RUB THE TAPE FIRMLY AND ALLOW ABOUT 20 SECONDS FOR THE ADHESIVE TO SET.
 3. GRASP THE SHORT TAB, QUICKLY LIFT THE TAPE FROM THE SURFACE.
 4. EXAMINE THE TESTED SURFACE USING 4X MAGNIFICATION. THERE SHALL BE NO EVIDENCE OF BLISTERING, PEELING, OR SEPARATION FROM THE BASE METAL OR UNDERCOATS.
 5. A FRESH PIECE OF TAPE SHALL BE USED FOR EACH TEST.
 6. REMOVE TAPE RESIDUE WITH SOLVENT (TRICHLOROETHANE) AND CHEESE-CLOTH (DDD-C-301)

DEFECT: MISSING OR TORN LAND

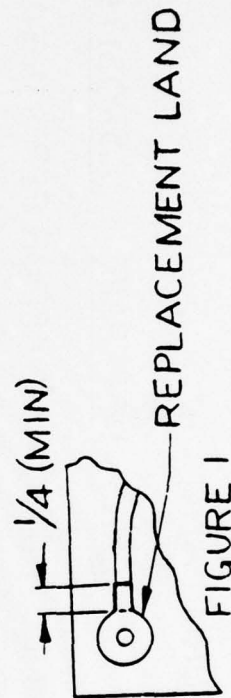

<u>CONDITION</u>	<u>CLASS OF REPAIR</u>	<u>DISPOSITION</u>
1. LAND, NORMALLY CONNECTED TO CIRCUITRY IS MISSING OR TORN.	A.	REPAIR PER SSR 5.0.3.2 CL A
2. THE HOLE LINING IS TORN.	A.	REPAIR PER SSR 5.0.3.2 CL A
3. THE MISSING LAND WAS ISOLATED.	B.	REPAIR PER SSR 5.0.3.2 CL B

REPAIR: CONDITION 1 & 2 - INSTALL REPLACEMENT LAND, THEN
INSTALL EYELET, THEN INSTALL COMPONENT

5.0.3.2.2 ACCEPTANCE CRITERIA FOR LAND REPLACEMENT.

- a. VERIFY THAT THE LAND IS CENTERED OVER THE HOLE AND IS NOT LIFTED MORE THAN .015.
- b. VERIFY THAT THERE IS NO ADHESIVE ON THE TOP SURFACE OF THE LAND NOR IN THE HOLE.
- c. VERIFY THAT THERE IS A MINIMUM OF $\frac{1}{4}$ " OVERLAP PER FIGURE 1 AND THAT SOLDER HAS REFLOWED SMOOTHLY OVER VISIBLE PERIMETER
- d. WHEN A BATCH CONTROL SAMPLE IS REQUIRED, REMOVE THE SAMPLE FROM THE CONTAINER, CUT IN TWO, AND INSPECT FOR THE FOLLOWING:
 1. THE BOTTOM AND SIDES SHALL NOT BE TACKY
 2. THE CUT EDGES SHALL BE FREE & UNIFORM IN COLOR & TEXTURE

5.0.3.2.5 ACCEPTANCE CRITERIA FOR COMPONENT INSTALLATION

- A. AFTER SOLDERING PARTS IN EYELETTED HOLES, THERE MUST BE FILLET OF SOLDER BETWEEN THE LAND AND THE FUNNEL FLANGE. FIG 4A OR 4B
- B. UNLESS OTHERWISE SPECIFIED, THE COMPONENT INSTALLATION AND SOLDERING MUST MEET THE GENERAL REQUIREMENTS OF D-73522.

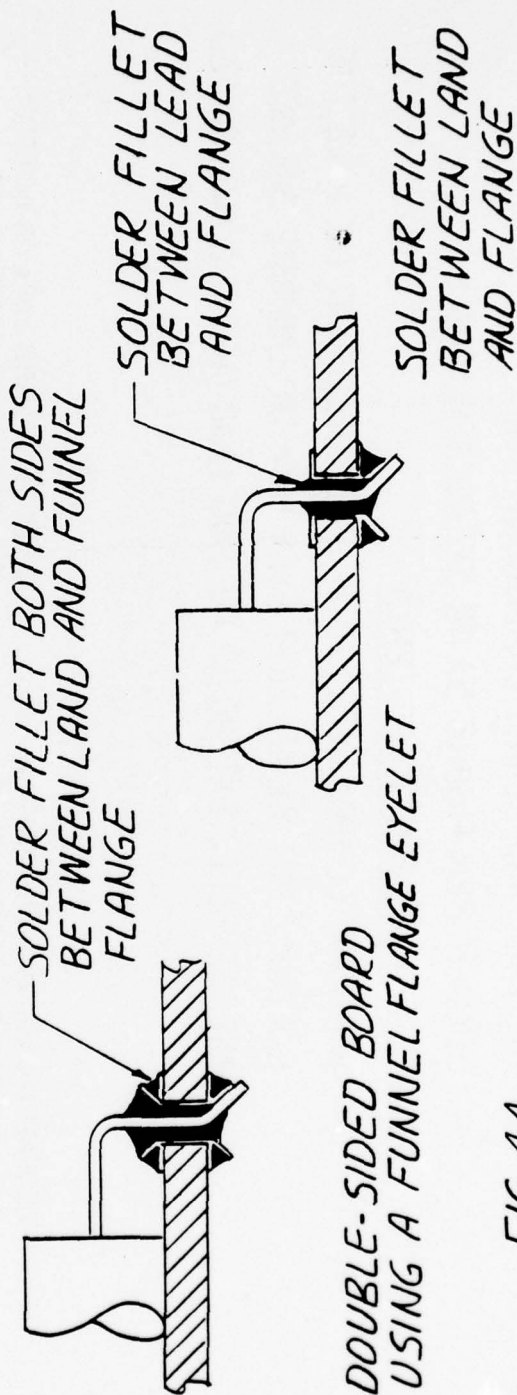

FIG 4A

SINGLE-SIDED BOARD USING
A FLAT FLANGE EYELET

FIG 4B

REPAIR: CONDITION 3. ISOLATED LANDS ARE NOT TO BE REPLACED.

5.0.3.2.1 REPAIR PROCEDURES

- a. INSTALL AND CLINCH COMPONENT LEAD.
- b. SOLDER PER FIGURE 5A OR 5B ~~AS~~ APPLICABLE

5.0.3.2.2 ACCEPTANCE CRITERIA

WHEN THE COMPONENT LEAD IS SOLDERED INTO THE HOLE, THE SOLDER SHALL BE AT LEAST EVEN WITH THE LAMINATE SURFACE AND THE FILLET EXTEND UP THE PART LEAD (REF: FIG'S 5A OR 5B)

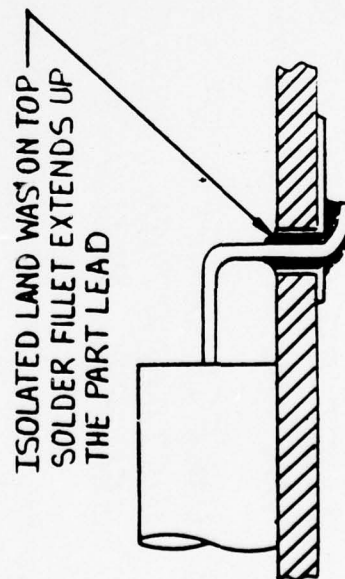

FIG 5A

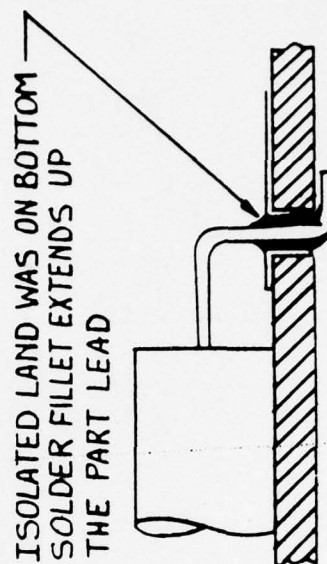

FIG 5B

5.0.3.2.3 ACCEPTANCE CRITERIA FOR EYELET INSTALLATION

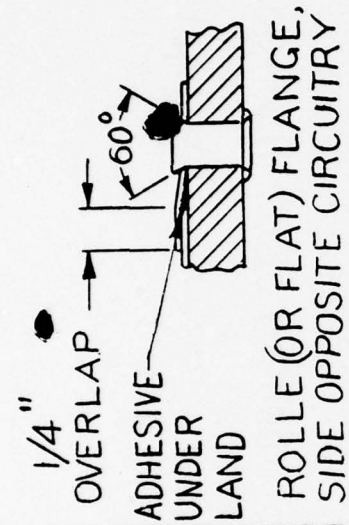

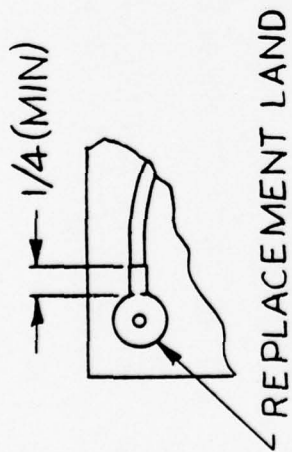

a. SWAGED EYELETS SHALL MEET THE FOLLOWING CONDITIONS:

1. NO TEAROUTS, SPLITS OR CIRCUMFERENTIAL CRACKS.
2. RADIAL CRACKS ARE ACCEPTABLE UNLESS THEY EXTEND INTO THE BARREL. A CRACK IS A RUPTURE, FLAW OR FRACTURE IN THE SURFACE OF THE MATERIAL WHICH DOES NOT EXTEND COMPLETELY THROUGH THE MATERIAL IN THE THICKNESS DIMENSION, OR IF IT DOES, THE MATERIAL BORDERING THE CRACK IS SEPARATED LESS THAN 0.005 INCH.

3. THE EYELET SHALL NOT COMPRESS OR DELAMINATE THE BASE MATERIAL.

4. THE EYELET SHALL HAVE A 0.000 TO 0.003 INCH LOOSE FIT.

b. THE REPLACEMENT LAND/CONDUCTOR/ EYELET SHALL MEET THE CRITERIA OF FIGURES 1, 2 AND 3.

SET EYELET TO .000 TO
.003" LOOSE FIT

SINGLE SIDEBOARD
FIGURE 2.

FIGURE 1.

- TEST PROCEDURES FOR EVALUATING POLYIMIDE BOARD MATERIAL
- RESULTS OF TESTS ON POLYIMIDE BOARD MATERIAL
- MANUFACTURING SOLDERING EVALUATION
- RESULTS OF MANUFACTURING SOLDERING EVALUATION
- MANUFACTURING EXPERIENCE
- TYPICAL ASSEMBLY USING POLYIMIDE BOARDS

TYPE OF PRINTED WIRING BOARD USED IN THE EVALUATION

HUGHES

MATERIALS

- EPOXY BASE LAMINATE - MIL-P-55617
- POLYIMIDE BASE LAMINATE - COMPANY SPECIFICATION

GEOMETRY

- TWO SIDED BOARD
- 0.020 INCH THICK
- 0.050 INCH PAD FOR THROUGH HOLE MOUNTED COMPONENTS
- 0.030 x 0.080 INCH PAD FOR SURFACE MOUNTED COMPONENTS

TEST PROCEDURES FOR EVALUATING POLYIMIDE BOARD MATERIAL

HUGHES

- MACHINABILITY – SHEARED, DRILLED, SAWED AND PUNCHED
- PROCESSING – EXPOSURE TO CHEMICAL AND PLATING SOLUTIONS USED IN FABRICATION
- HEAT RESISTANCE – 25 SOLDERING AND DESOLDERING OPERATIONS
- MEASLING – THREE CYCLES OF THE FOLLOWING:
 - 1) BOILED IN WATER FOR 30 MINUTES
 - 2) COOLED TO -65°C FOR 30 MINUTES
 - 3) FLOATED ON MOLTEN SOLDER AT 260°C FOR 20 SECONDS

RESULTS OF TESTS ON POLYIMIDE BOARD MATERIAL

HUGHES

- MACHINABILITY – NO EVIDENCE OF DELAMINATION
- PROCESSING – NO EFFECT
- HEAT RESISTANCE – VISUAL EXAMINATION (20X) NO LIFTED PADS, NO HOLE DAMAGE, MEASLING, SCORCHING OR BLISTERING
- MEASLING – NO MEASLING OR DELAMINATION

MANUFACTURING SOLDERING EVALUATION

HUGHES

THE PROCEDURE USED TO EVALUATE THE SOLDERING RESISTANCE OF THE POLYIMIDE VERSUS EPOXY PRINTED WIRING BOARDS WAS AS FOLLOWS:

- PROVIDED ONE BOARD OF EACH TYPE TO FOUR DIFFERENT ASSEMBLERS
- SOLDERED AND DESOLDERED A RESISTOR AND A FLATPACK TO THE BOARDS. THE SAME PAD PATTERNS WERE USED ON EACH OPERATION.
- EXAMINED BOARDS AFTER EACH SOLDERING AND DESOLDERING OPERATION TO DETERMINE PAD DAMAGE.

RESULTS OF MANUFACTURING SOLDERING EVALUATION

HUGHES

TYPE OF BOARD	FLATPACK		RESISTOR	
	NO. OF CYCLES	DAMAGE	NO. OF CYCLES	DAMAGE

APPENDIX P
GENERAL REPAIR OF PRINTED
WIRING BOARD ASSEMBLIES

M. Perchick
RCA Astro-Electronics Division

1. DAMAGED PRINTED CIRCUIT CONDUCTOR (2 CHARTS)

Description of Condition

A portion of the conductor is damaged by a break, scratch, nick, or reduction in cross-section below the permitted reduction of 20%.

Limits on Application

1. No repairs to unassembled circuit boards are permitted.
2. Repair is limited to 5 conductors or 5% of the PC board conductors, whichever is the larger number.

Method Description

A solid jumper wire is soldered into a position which bridges the damaged area.

Cut any loose printed circuitry that might break off later and remove any solder in the break area (See Figure 1).

Clean both sides of break area with alcohol.

Tin printed circuit trace wire.

Center wire over damaged area, solder and clean.

2. LIFTED EDGE CRITERIA (1 CHART)

1. Repairs are only made if the lifting or separation of pads exceeds the established limits. A 0.0015 inch feeler gauge may penetrate a distance equal to no more than one half (1/2) the distance from the interface of the hole to the nearest edge of the terminal area (annular ring) for not more than 180° of the periphery.

CRITERIA FOR TARGET PADS (BOARDS SPRAYED WITH CONATHANE)

A target pad is defined as a printed circuit terminal area having no surface conductive trace extending from it.

1. A lifted target pad on the component side of a multilayer PCB is acceptable provided that it is securely soldered to the component lead and does not prevent the inspector from determining the quality and quantity of solder in the PTH.
2. A totally separated target pad on the component side of a multilayer PCB may be removed.

3. REBONDING OF LIFTED PADS (2 CHARTS)

Description of Condition

The terminal pad area of a printed circuit conductor has become lifted or otherwise separated from the basic board laminated.

Limits on Application

1. No repairs to unassembled circuit boards are permitted.
2. Repair is limited to 5 pads, or 5% of the PC board pads, whichever is the larger number.

Method

An epoxy adhesive is used to rebond the damaged pad, or a replacement pad that is soldered in place.

Remove solder component or stitch from the lifted pad.

Abrade the board surface where it interfaces with the lifted pad.

If edge is lifted bond without abrading.

Clean the under surface of the lifted pad.

Clean board and pad interface area with alcohol dried thoroughly.

Apply a thin even coat of Epon 828.

Press pad into its original position on board.

The adhesive is cured.

The component or stitch wire reinstalled.

Solder and clean.

Recoat the repaired pad on both sides of board with conathane.

4. DELAMINATION ON MULTILAYER BOARDS (3 CHARTS)

Description of Condition

A localized swelling and separation between any of the layers of the base laminate and/or between the laminate and the metal cladding.

Limits on Application

1. Repairs to delaminations which touch or cross thru-hole connections require an MRB.
2. Delamination must be less than 10% of the surface area.

Method

The delaminated areas are vacuum impregnated with an epoxy-polyamide.

Clean area(s) of board to be repaired, using TF Freon.

Using a pin vise and small drill, puncture each area in at least (2) spots, opposite each other, around the perimeter of the delamination. Remove any chipped-off material.

Place board in vacuum oven to completely dry.

Using Alba-seal, form a pocket over the area(s) to be reworked. Fill this pocket with a sufficient amount of residweld to flood the area.

Place board in vacuum chamber at room temperature.

Remove Alba-seal and excess material.

If a bubble exists and will not be acceptable when cured, clamp a piece of teflon on the bump to eliminate it while curing.

Remove any squeezed out material.

Remove flashing and excess material - clean board.

5. REMOVAL OF UNWANTED THRU-HOLE CONNECTION (2 CHARTS)

Description of Condition

An erroneous connection of an internal circuit layer at a plated thru-hole stack.

Limits on Application

This repair cannot be used if any internal layer connections to the plated thru-hole barrel must remain intact, as all internal connections are removed.

Method

The plating in the thru-hole and all interconnections are removed by oversized drilling. Interconnection between the external circuits is made with a sleeved and soldered jumper wire.

Drill out plating with a drill .005" larger than the finished hole size.

Examine the walls of the drilled hole to insure no plating or metal smear exists. If metal still remains, redrill with the next larger size drill.

Circuit check pad on both sides of board to all inner layers to insure short has been removed.

Prein stitch material.

Apply stitch to board in line with traces. Install insulating sleeving to prevent stitch shorting to inner layers. Sleeving must be flush with the board surface at a minimum, and as a maximum shall not extend more than 1/32" above the board surface. Solder stitch to trace only.

Acceptance Criteria

The added thru-hole insulation shall be unbroken and extend $1/32$ of an inch above the pad surface on both sides. Jumper wire soldering shall be in accordance with the quality standard for the assembly.

6. PLUGGING HOLES IN EPOXY-GLASS BOARDS (2 CHARTS)

Limits on Application

1. Holes up to approximately .12" diameter may be repaired by filling directly with adhesive.
2. Holes over .12" and up to .50" diameter shall be repaired by bonding a plug of epoxy glass into a drilled or milled hole.
3. Holes under .12" diameter may be plugged if maximum strength is required or redrilling shall be performed in/or adjacent to the repaired area.

Method

Determine the size and method of repair required.

Drill or mill hole to required size.

Form plug to allow approximately .003 - .006" clearance on diameter between plug and hole (this will allow an adhesive joint thickness .004 + .002 - .001).

Clean with Acetone.

Bond with M688-CH8.

Apply adhesive to board.

Insert plug (methods 2 and 3 only).

Remove excess resin.

Place repaired area on a sheet of mylar or teflon.

Clean.

7. REMOVAL OF UNWANTED CIRCUITRY (2 CHARTS)

Description of Condition

An engineering change to the electrical circuit of a populated printed circuit board requires that a circuit trace must be cut.

Limits on Application

The cutting of a circuit trace must be authorized by engineering change notice.

Method Description

A minimum 1/32 inch section of the trace is cut and removed.

8. JUMPER BY-PASS OF MISSING OR DAMAGED PC PAD (2 CHARTS)

Description of Condition

A printed circuit pad on the part side of the board is damaged beyond repair or is missing.

Limits on Application

A maximum of three repairs is permitted for a board.

Method

Clean the circuit trace and lead of any coating.

Cut a small piece of 2010105 buss wire. Buss wire cross-sectional area must be at least equal to the trace cross-sectional area.

Form a small hump in the jumper.

Lap solder to the trace, and wrap and solder to the part lead.

9. REROUTING OF PRINTED CIRCUITRY (6 CHARTS)

Description of Condition

Non-standard attachment of jumper wires to part leads and solder traces, and terminals.

Limits on Application

1. These non-standard lead attachment methods shall be used only on populated assembly.
2. There shall be a limit of 5 jumper wires attached to a populated board assembly.

Type 1 - Wrap to Part Side Lead

Carefully remove any protective coating from the part lead and any top side solder pad at the lead using a soldering iron.

Brush clean the area with solvent and remove any solder which may interfere with a tight wire wrap. (Keep plated hole filled with solder).

Wrap the jumper wire around the part lead from 1/2 to 1 full turn. Solder and clean the connection keeping all solder out of the stress relief bend.

Check the opposite side of the board for solder connection quality and rework as necessary.

Type 2 - Wrap to Wiring Side Lead

Remove any solder from the part lead or clinch.

Carefully straighten the lead clinch to form a vertical post. Extreme caution is required so as not to lift or tear copper circuitry.

Wrap the jumper lead 1/2 to 1 full turn around the vertical lead. There must be sufficient vertical lead to permit the observing its contour in the finished connection, and the determination of acceptable filleting.

Solder in place.

Clean flux residue from joint with solvent.

Check opposite side for connection disturbance.

Type 3 - Lap Solder to PC Trace

Clean lap solder location of protective coating using a soldering iron.

Clean with solvent and retin.

Cut exposed jumper conductor 1/16 to 1/8 inch long.

Holder in position and solder a minimum of 1/16 inch along the trace.

Clean away flux residue with solvent.

Type 4 - Flat Buss Jumper Addition to IC Lead and PC Traces

Remove coating if required.

Clean.

Tin buss wire.

Apply flux.

Position bus wire and hole in place to restrict movement during soldering. Bus wire must be positioned on I.C lead in a manner that will prevent the I.C. lead stress relief from being negated.

Clean.

Type 6 - Bond Mounted Bifurcated Terminal Assembly

Limits on Application

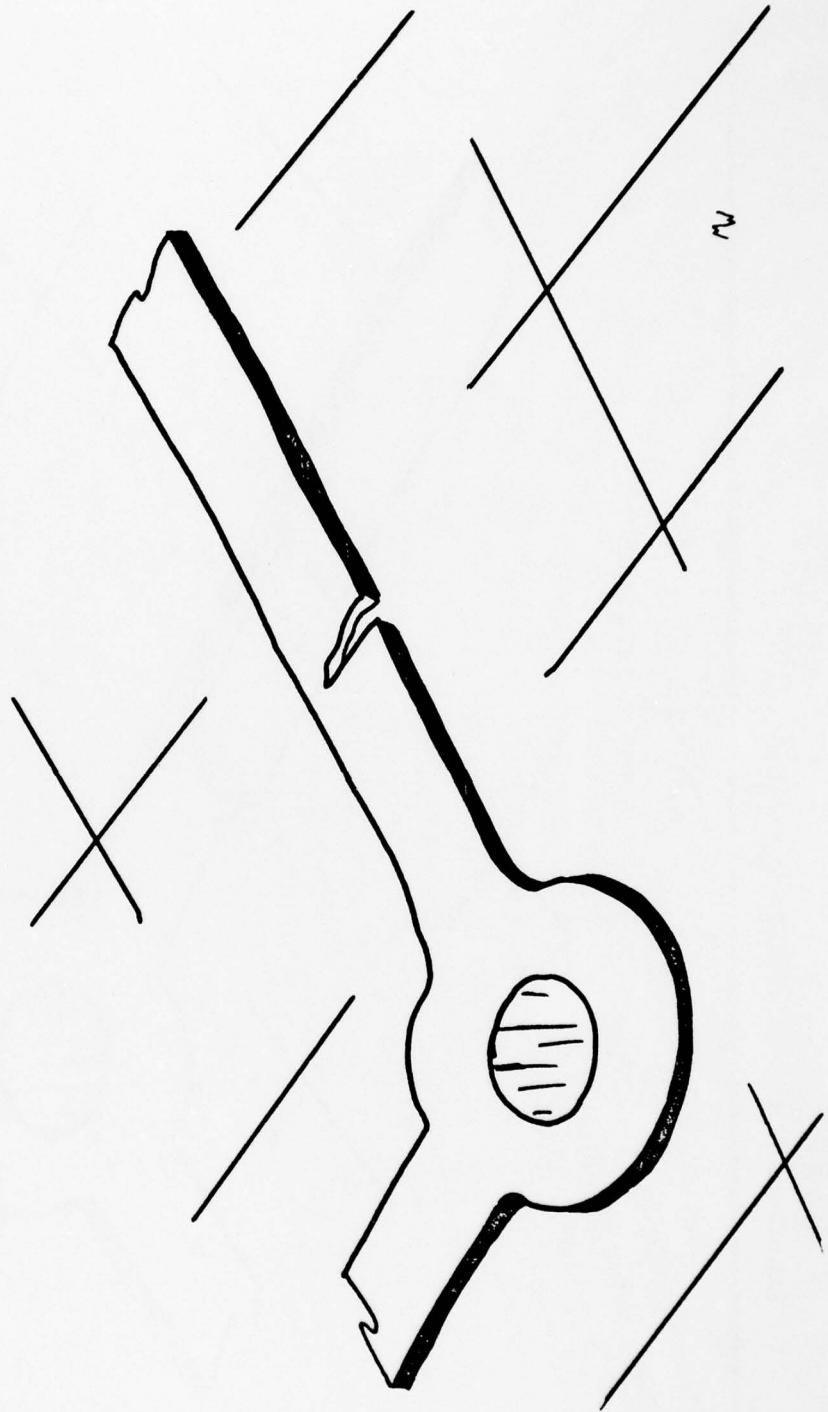

No more than 6 bond on terminals per board assembly will be accepted.

Method

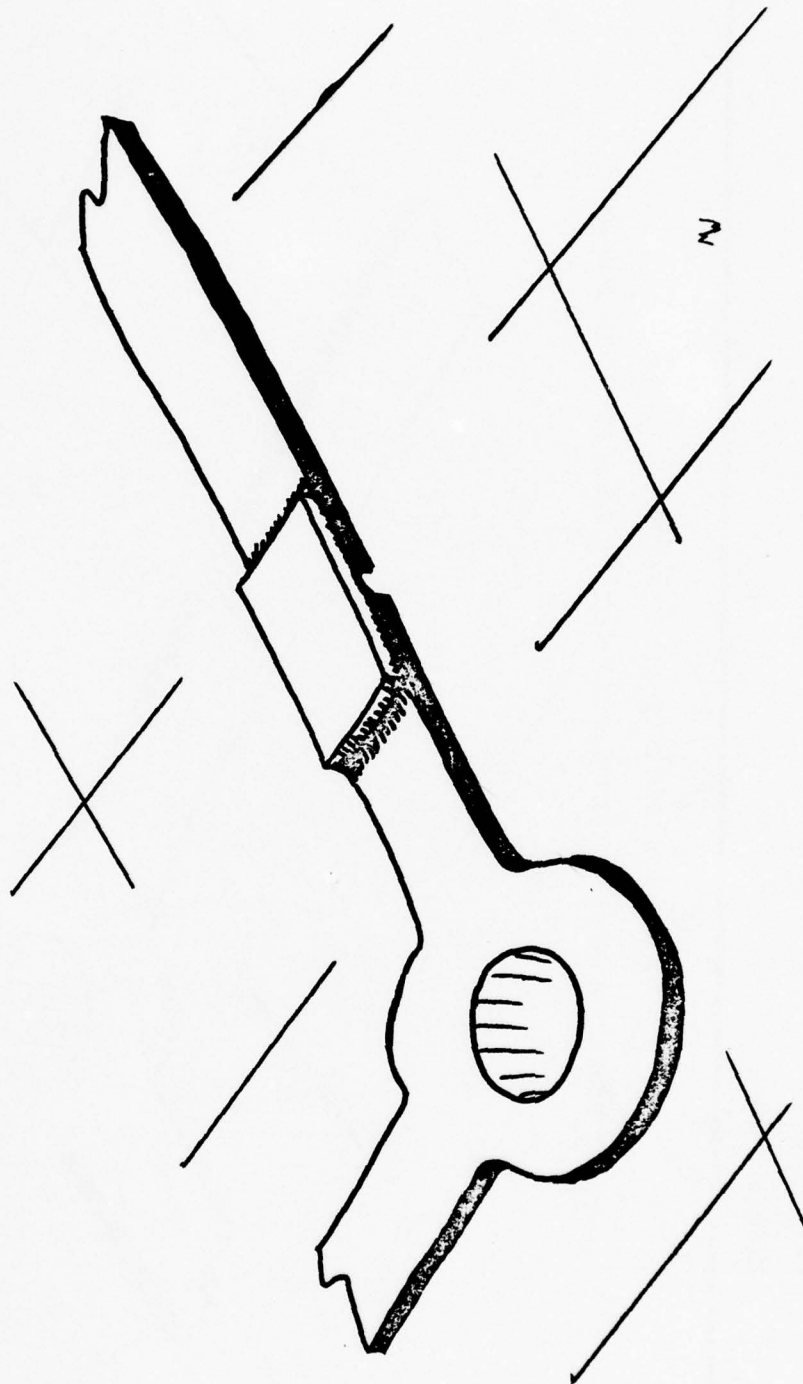

The terminals are bonded in place using epoxy.

APPENDIX Q
FOAMED MODULE REPAIR

M. Furney
General Dynamics Corporation

- FOAMED MODULE REPAIR:
- FOAMS ARE USED BY CONVAIR FOR ENVIRONMENTAL PROTECTION, VIBRATION DAMPING AND LIGHT WEIGHT.
- TWO TYPES OF FOAMED MATERIALS ARE USED:
 1. RIGID POLYURETHANE
 2. FLEXIBLE SILICONE.
- ELECTRONIC MODULES ARE ENCAPSULATED IN THE RIGID FOAM
- WIRING HARNESSSES USE THE FLEXIBLE FOAM

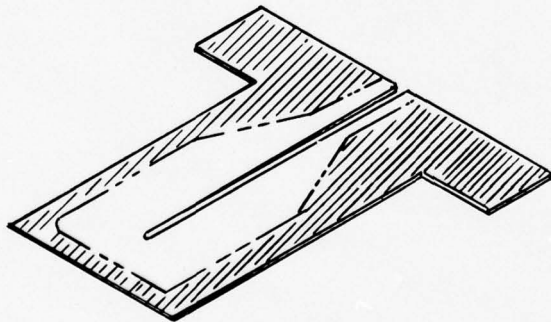

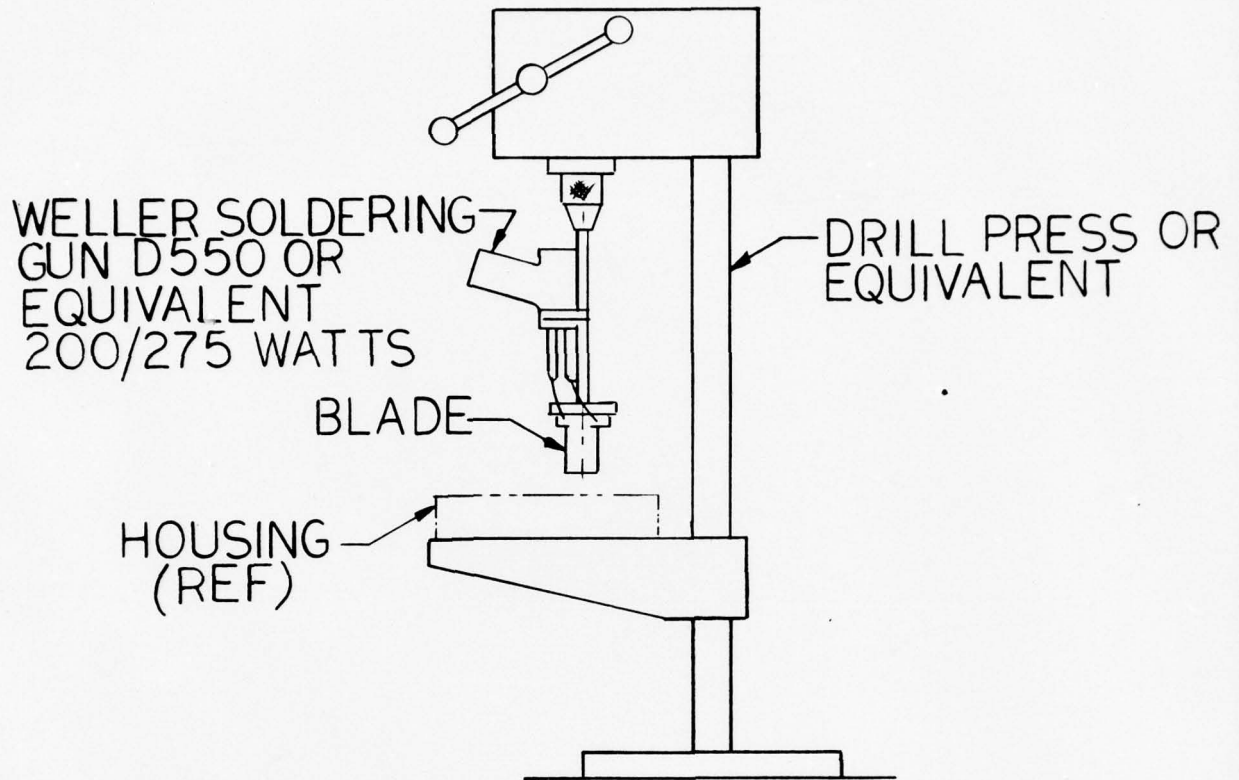

- REMOVAL OF MODULES FROM THE PACKAGE:
- EXPOSE ELECTRICAL CONNECTIONS BY REMOVING FLEXIBLE SILICONE FOAM.
- REMOVE ALL ELECTRICAL CONNECTIONS AND MECHANICAL FASTENERS FROM THE MODULE
- THE LOCATIONS OF MODULES ARE LABELED BY A STENCIL APPLIED AT THE TIME OF FABRICATION.
- A "HOT KNIFE" ($170 \pm 5^{\circ}\text{C}$) IS USED TO SEVER THE FOAM.

- THE PACKAGE HOUSING IS POSITIONED SUCH THAT THE BLADE CORRESPONDS TO THE STENCIL LOCATION OF THE MODULE TO BE REMOVED.
- WHEN THE BLADE REACHES OPERATING TEMPERATURE, IT IS SLOWLY AND CAREFULLY LOWERED INTO THE FOAM
- PRECAUTION - IF THE BLADE DOES NOT READILY PENETRATE THE FOAM, MANUALLY REMOVE THE SKIN LOCALLY PRIOR TO INSERTING THE BLADE.
- AFTER THE BLADE CONTACTS THE HOUSING FLOOR, IT IS REMOVED AND THE PROCEDURE IS REPEATED UNTIL THE MODULE IS SEPARATED FROM THE FOAM.

- AFTER THE FOAM HAS BEEN SEVERED WITH THE HOT KNIFE, THE MODULE IS CAREFULLY REMOVED.
- THE HOUSING IS INVERTED AND AN ARBOR PRESS IS USE TO REMOVE THE MODULE.
- IN ORDER TO EXPOSE THE SUSPECT COMPONENT, ONLY MANUAL METHODS ARE USED.
- WHEN THE FOAM HAS BEEN REMOVED FROM THE SUSPECT COMPONENT, THE BOARD IS SENT FOR STANDARD REWORK AND REPAIR.

- AFTER REWORK IS ACCOMPLISHED, THE MODULE IS REPLACED.
- BEFORE INSERTION, ALL LOOSE PARTICLES OF FOAM ARE REMOVED FROM THE ATTACHMENTS POINT ON THE FLOOR OF THE HOUSING.
- THE MODULE IS INSTALLED AND TESTED IN ACCORDANCE WITH THE ENGINEERING DRAWING.
- THE REPLACED MODULES ARE THEN REFOAMED, STENCILED AND CONFORMAL COATED.

- RATIONALE FOR MANUAL FOAM REMOVAL TECHNIQUES
- CONVAIR USES ONE MIL MYLAR SUPPORTED BOARDS
- AIR PRESSURIZED ABRASIVES GENERATE STATIC ELECTRICAL CHARGES WHICH CAN DESTROY STATIC SENSITIVE COMPONENTS.
- GREATER CARE AND CONTROL IS ABLE TO BE EXERCISED DURING THESE HAND OPERATIONS.

APPENDIX R
REPAIR OF PRINTED WIRING
BOARD ASSEMBLIES

R. C. Block
Hughes Aircraft Company

MODIFICATION OF PRINTED WIRING ASSEMBLIES TO INCORPORATE ENGINEERING CHANGES

R-1

HUGHES

**MODIFICATION OF PRINTED WIRING
BOARD ASSEMBLIES TO INCORPORATE
ENGINEERING CHANGES**

HUGHES

- REMOVAL OR ADDITION OF PWB CIRCUIT CONDUCTORS
- DRILLING HOLES IN PWB'S TO ADD NEW COMPONENTS
- COMPONENT REMOVAL AND REPLACEMENT ON PWB'S

CONDUCTOR REMOVAL

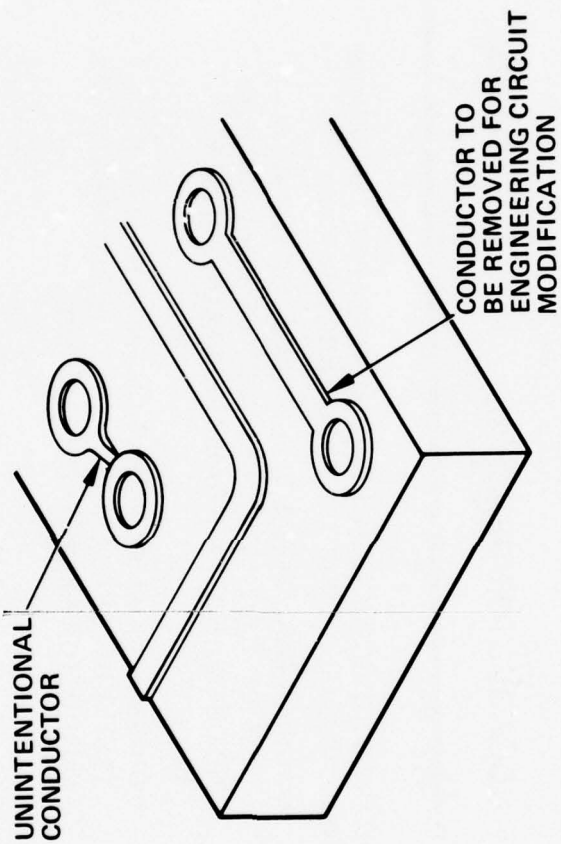

HUGHES

CIRCUIT CONDUCTORS ARE REMOVED FROM PRINTED WIRING BOARD ASSEMBLIES FOR THE FOLLOWING REASONS:

- DURING FUNCTIONAL ELECTRICAL TESTS, IT IS DETERMINED THAT A "DESIGNED IN" CONDUCTOR IS NOT REQUIRED AND THUS THE CIRCUIT MUST BE MODIFIED
- DURING VISUAL EXAMINATION AND/OR ELECTRICAL TEST IT BECOMES EVIDENT THAT AN "UNINTENTIONAL," CONDUCTOR EXISTS IN THE CIRCUIT

**TYPICAL EXTERNAL CONDUCTORS
TO BE REMOVED**

HUGHES

TOOLING FOR CONDUCTOR REMOVAL

HUGHES

THE TOOLS REQUIRED FOR REMOVING CONDUCTORS FROM
PRINTED WIRING BOARD ASSEMBLIES ARE:

- X-ACTO KNIFE WITH CURVED BLADE (EXTERNAL CONDUCTORS)
- SOLDERING IRON (600° F TIP) (EXTERNAL CONDUCTORS)
- DRILL PRESS, DRILL BIT, END MILL (INTERNAL CONDUCTORS)

EXTERNAL CONDUCTOR REMOVAL PROCEDURE

HUGHES

THE FOLLOWING PROCEDURE HAS BEEN ESTABLISHED FOR
REMOVING EXTERNAL CONDUCTORS FROM THE SURFACE
OF A PWB ASSEMBLY

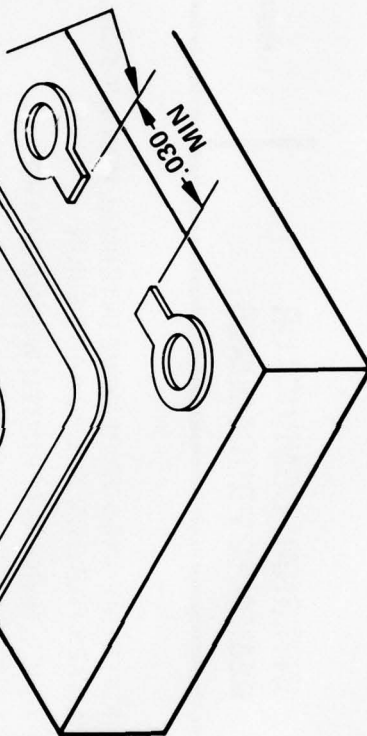

- CUT CONDUCTOR AT TWO PLACES USING AN X-ACTO KNIFE
- HEAT THE PORTION OF THE CONDUCTOR TO BE REMOVED
WITH A SOLDERING IRON TO REDUCE ITS ADHESION TO THE
BOARD
- PEEL AWAY SEVERED PORTION OF CONDUCTOR

TYPICAL REMOVED EXTERNAL CONDUCTORS

HUGHES

AMOUNT OF UNINTENTIONAL
CONDUCTOR REMOVED
SHALL COMPLY WITH
MINIMUM SPACING
REQUIREMENTS

TYPICAL LENGTH
OF CONDUCTOR
REMOVED DURING
ENGINEERING
CIRCUIT
MODIFICATION

INTERNAL CONDUCTOR REMOVAL PROCEDURES

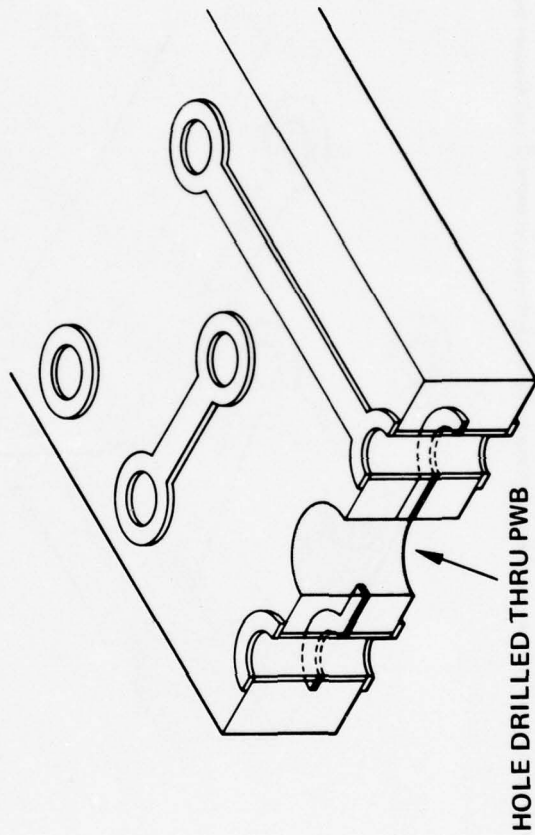

HUGHES

THE PROCEDURE USED TO REMOVE INTERNAL CONDUCTORS FROM
MULTILAYER PWB'S ON THE BOARD DESIGN

- DRILL THROUGH PRINTED WIRING BOARD
- DRILL THROUGH PLATED THROUGH HOLE
- PARTIAL DRILL THROUGH BOARD

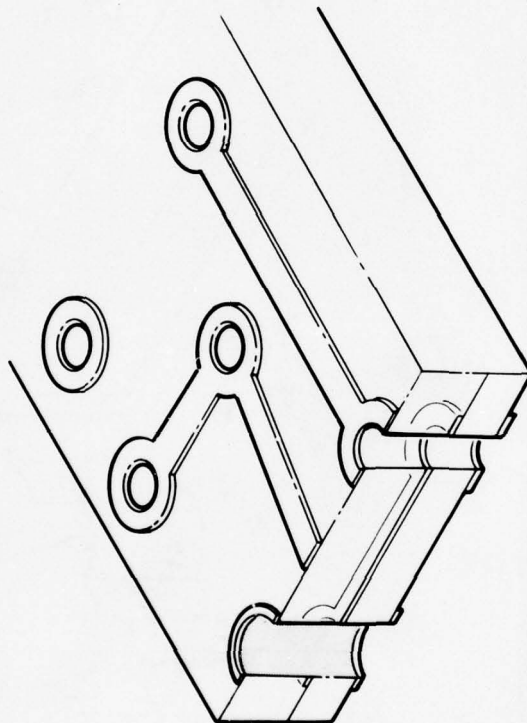

**DRILL THROUGH PRINTED
WIRING BOARD**

HUGHES

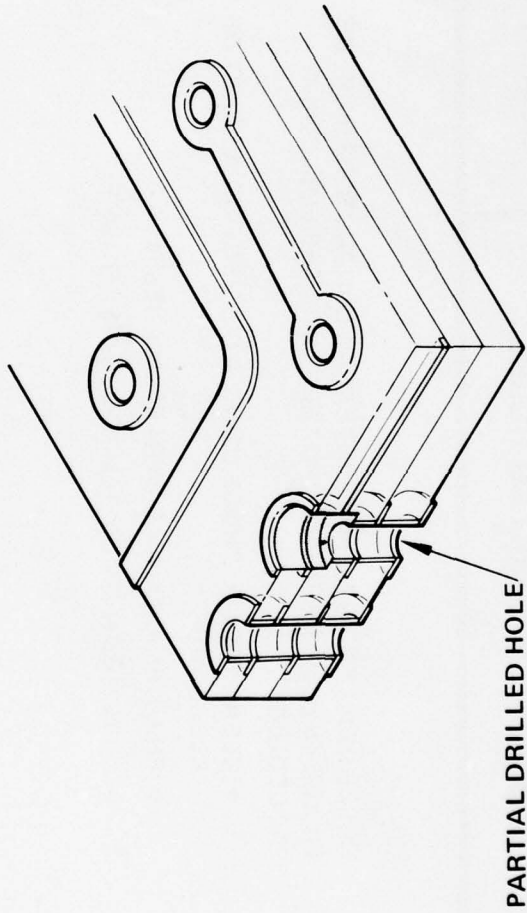

DRILL THROUGH PLATED
THROUGH HOLE

HUGHES

HUGHES

PARTIAL DRILL THROUGH BOARD

FILLING OF DRILLED HOLES

HUGHES

HOLES DRILLED TO REMOVE INTERNAL CONDUCTORS MUST BE FILLED WITH RESIN IN ACCORDANCE WITH THE FOLLOWING PROCEDURE:

- CLEAN DRILLED HOLE USING A SOLVENT OR A BLAST OF CLEAN AIR
- FILL DRILLED HOLE WITH EPOXY RESIN
- CURE RESIN (ROOM TEMPERATURE TO 160°F)

ADDITION OF CONDUCTORS TO PWB ASSEMBLIES

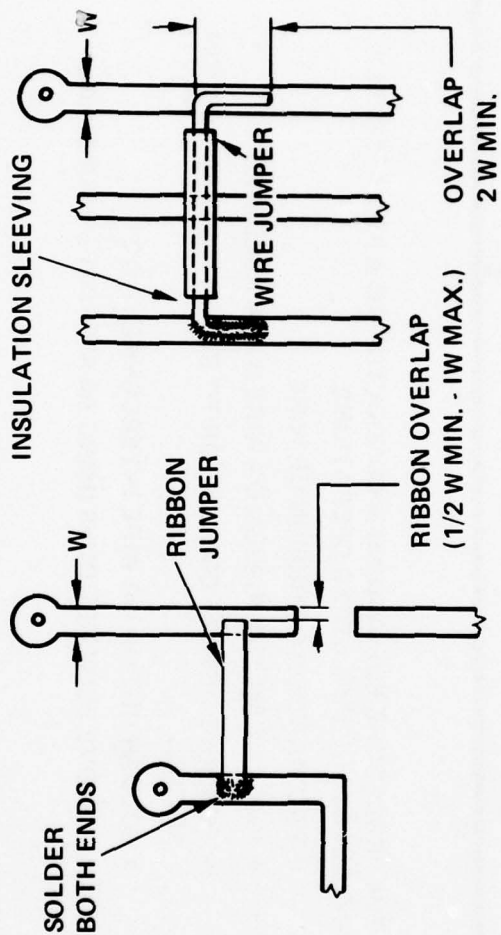

HUGHES

THE PROCEDURE FOR ADDING A CONDUCTOR TO A PWB ASSEMBLY INVOLVES THE FOLLOWING OPERATIONS:

- PREPARATION OF RIBBON OR WIRE
- INSULATING THE RIBBON OR WIRE WHEN REQUIRED
- FORMING OF WIRE CONDUCTOR TO REACH ITS TERMINATION POINTS
- SOLDER RIBBON OR WIRE INTERCONNECTION
- REMOVE FLUX RESIDUES USING AS APPROVED PROCEDURE

HUGHES

ADDITION OF SURFACE CONDUCTORS

DRILLING HOLES IN PWB'S FOR ADDING COMPONENTS

HUGHES

- TYPES OF COMPONENTS ADDED TO PWB'S
 - AXIAL DISCRETE COMPONENTS – RESISTORS, CAPACITORS, DIODES, ETC.
- FACTORS TO CONSIDER RELATIVE TO THE LOCATION OF HOLES AND COMPONENTS
 1. MAINTAIN MINIMUM SPACING FROM CONDUCTORS AND COMPONENTS
 2. BOTTOM MOUNT VS. TOP MOUNT

TOOLS FOR ADDING NEW COMPONENTS TO PWB ASSEMBLIES

HUGHES

THE FOLLOWING TOOLS ARE REQUIRED TO ADD ADDITIONAL
COMPONENTS TO PWB ASSEMBLIES:

- DRILL PRESS AND DRILL BITS
- PIN VISE
- TERMINAL SWAGING TOOL

METHODS FOR ADDING COMPONENTS TO PWB ASSEMBLIES

HUGHES

THE FOLLOWING ARE THE TWO ESTABLISHED METHODS FOR
ADDING COMPONENTS:

- DRILLED HOLES AND JUMPER WIRES
- DRILLED HOLES AND SWAGED TERMINALS

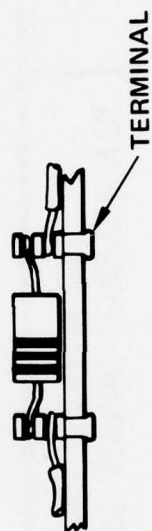

TYPICAL INSTALLATIONS IN DRILLED HOLES

HUGHES

COMPONENT SIDE OF PWB

BONDING MATERIAL

POTENTIAL PROBLEM DURING COMPONENT REPLACEMENT

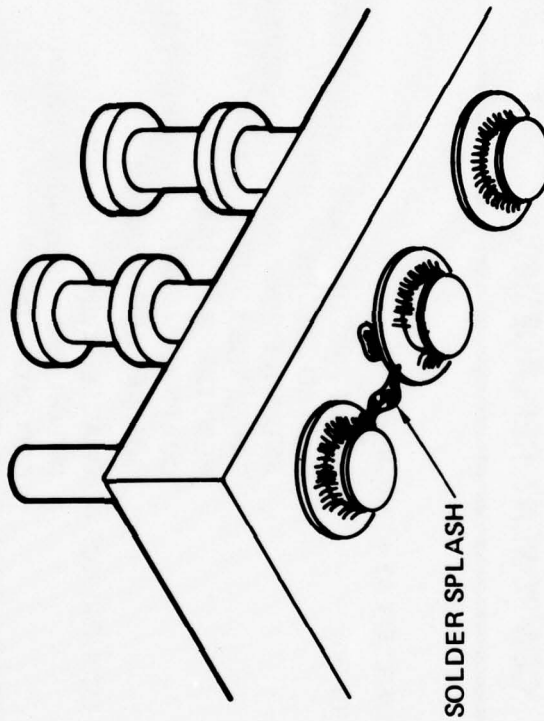

HUGHES

SOLDER "SPLASH" PROBLEM

- CAUSE – REMELTING OF SOLDER UNDER COVERED OR COATED SOLDER JOINTS RESULTS IN SOLDER AND AIR EXPANSION. THIS CONDITION MAY CAUSE THE SOLDER TO SEEK THE LOWEST RESISTANCE PATH AND FLOW UNDER COATING MATERIAL AND SHORT TO AN ADJACENT CONDUCTOR
- OCCURRENCE – SWAGED SIDE OF TERMINALS WHEN SOLDERING OR DESOLDERING IS PERFORMED ON OPPOSITE SIDE OF TERMINAL

HUGHES
HUGHES AIRCRAFT COMPANY

TYPICAL "SPLASH" OCCURRENCE

PREVENTION OF SOLDER "SPLASH"

HUGHES

SOLDER "SPLASH" PROBLEM

- PREVENTION – BREAK OR REMOVE COATING FROM SWAGED SIDE OF TERMINAL PRIOR TO SOLDERING
- PROCEDURE
 - 1) REMOVE COATING FROM SWAGED SIDE
 - 2) SOLDER OR DESOLDER LEADS OR WIRES
 - 3) INSPECT
 - 4) RECOAT TERMINAL

LIFTED CIRCUITRY

● REPAIR APPLIES TO:

- (A) CONDUCTOR RUN
- (B) PAD WITHOUT PLATED THRU HOLE (SHOW FIGURE 1)
- (C) PAD WITH PLATED THRU HOLE

(REPAIR OF OPEN CIRCUITS MUST ALSO BE ACCOMPLISHED FOR (C))

● ACCEPT CRITERIA

(SHOW FIGURE 2)

- 1) PAD THAT IS RAISED < ITS OWN THICKNESS FROM THE CIRCUIT BOARD SURFACE AND HAS AT LEAST 3/4 RESIDUAL ADHERENCE TO THE BASE MATERIAL
- 2) ALL RAISED NONFUNCTIONAL PADS THAT SHOW FIRM ADHERENCE TO THE BASE MATERIAL ARE ACCEPTABLE
- 3) INTERFACIAL HOLES THAT SHOW EVIDENCE OF FRACTURED PLATING ARE UNACCEPTABLE
- 4) THE LIFT SHALL NOT EXTEND TO THE PLATED HOLE INTERFACE

RESTRICTIONS:

- 1) LIFTED SECTION OF A CIRCUIT RUN MAY NOT EXCEED ONE HALF THE DISTANCE BETWEEN THE TWO CIRCUIT TERMINATIONS
- 2) MUST NOT BE LONGER THAN ONE HALF INCH
- 3) MUST NOT HAVE ANY EVIDENCE OF CREASES, FOLDS OR OTHER DAMAGE

IN THESE CASES THE REPAIR MUST BE PERFORMED IN ACCORDANCE WITH THE PROCEDURE FOR MISSING, DAMAGED OR CUT CIRCUITRY WHICH WILL BE EXPLAINED LATER

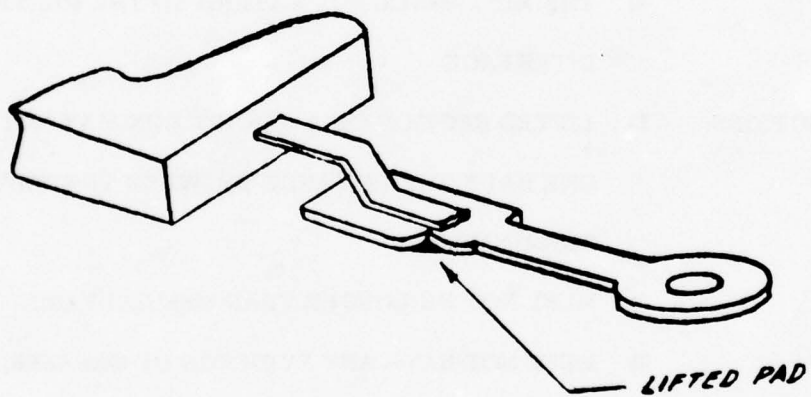

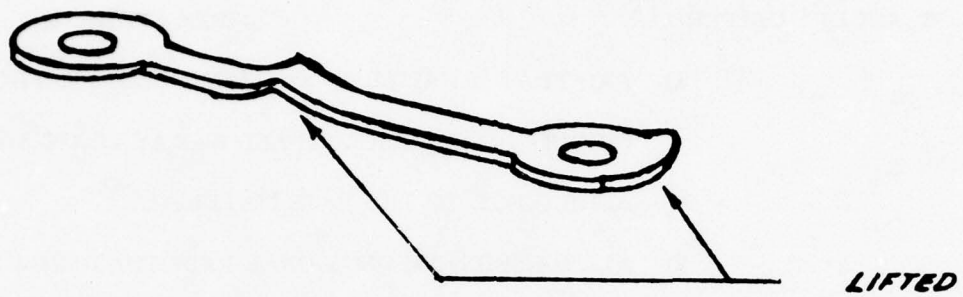

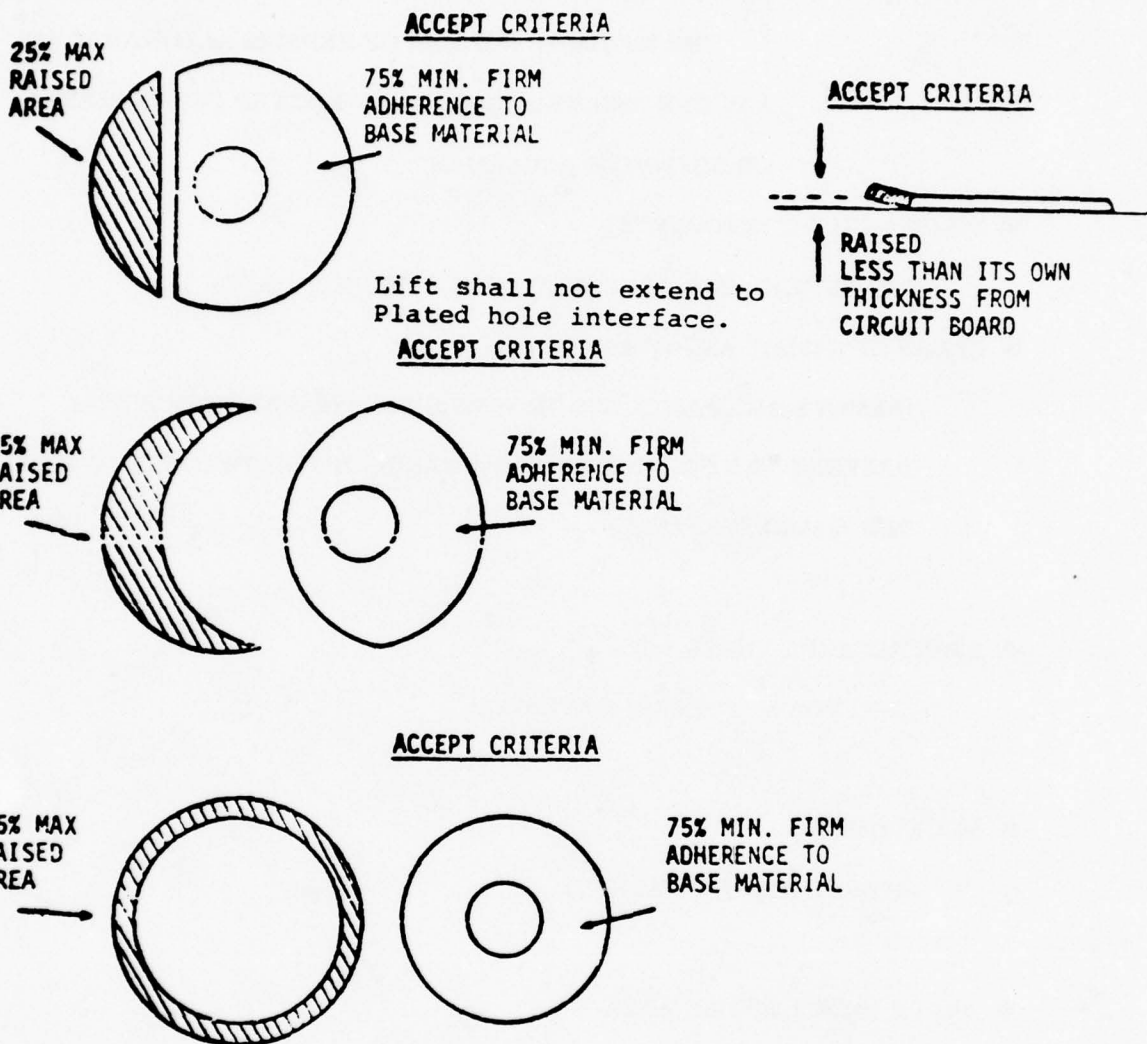

FIGURE 1

ACCEPT CRITERIA: A pad that is raised less than its own thickness from the circuit board surface and has at least three-fourths (3/4) residual area of adherence to the base material.

NOTE:

All raised non-functional pads that show firm adherence to the base material are acceptable.

Cut-away view of raised/adhering portions of pads.

Interfacial holes that show evidence of fractured plating are unacceptable.

FIGURE 2

THIS PROCEDURE SHALL NOT BE USED FOR REPAIR TO
PADS USED AS ELECTRICAL CONTACT WITH MATING CON-
NECTORS SUCH AS ON EDGE INSERTABLE DESIGNS.

THE MAXIMUM NUMBER OF REPAIRS ALLOWABLE ON
ANY ONE ASSEMBLY SHOULD BE LIMITED PER INTERNAL
OR CUSTOMER AGREEMENT

- DISASSEMBLE COMPONENTS

(TO OBTAIN FREE ACCESS TO AREA BEING REPAIRED)

- CLEAN CIRCUITRY AND BOARD

(REMOVE ALL PARTICLES OR FOREIGN SUBSTANCES WHICH WILL
PREVENT THE CONDUCTOR FROM MAKING INTIMATE CONTACT WITH
THE BOARD SURFACE)

- EXAMINE AREA UNDER 10X

(FOR VOIDS, FOREIGN MATERIAL)

- MIX EPOXY

(HYSOL) (OR EQUIVALENT)

- APPLY UNDER ENTIRE AREA

(APPLY A SMALL QUANTITY OF EPOXY ASSURING THAT THE MIXTURE
IS APPLIED UNDER THE ENTIRE LENGTH OF THE LIFTED CONDUCTOR
OR LIFTED AREA OF THE PAD)

● APPLY PRESSURE

(TO CONDUCTOR OR PAD USING ORANGE-WOOD STICK SO THAT CONTACT IS MADE BETWEEN THE CONDUCTOR AND BOARD SURFACE)

● REMOVE EXCESS EPOXY

(FROM SURFACES TO BE SOLDERED OR FROM PLATED THRU HOLE PRIOR TO CURING - SCRAPING OF EPOXY AFTER CURING IS NOT PERMISSIBLE)

● ALLOW EPOXY TO CURE

● THOROUGHLY CLEAN REPAIRED AREA

(USING CLEANING SOLVENT AND BRUSH)

● INSPECT 10X

(FOR VOIDS, FOREIGN MATERIAL, ADHESION)

● NONFUNCTIONAL IC LEADS

(SHOW FIGURE 3)

● CUT IC LEAD(S) 1/16" FROM BODY

● INSPECT COMPONENT BODY 20X

(THE AREA OF THE SEAL SHALL SHOW NO EVIDENCE OF DAMAGE)

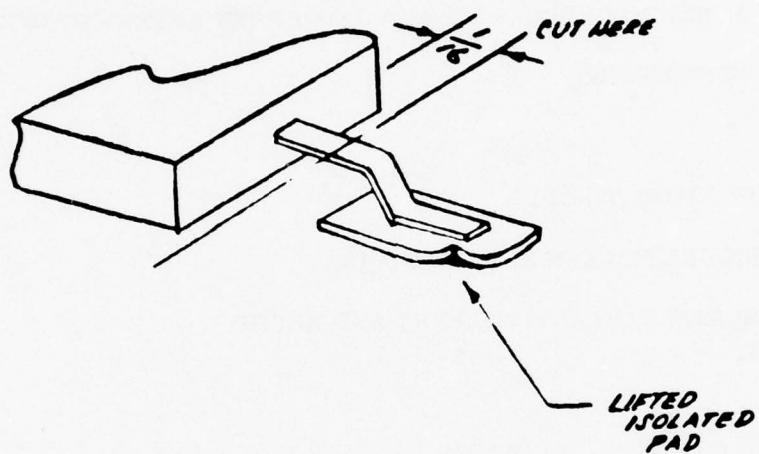

FIGURE 3

II OPEN CIRCUITS

(INCLUDES OPEN PLATED THRU HOLES ON MULTILAYER BOARDS)

- DETERMINE END POINTS OF DEFECTIVE CIRCUIT

(FOR MULTILAYER BOARDS ALSO DETERMINE THE TERMINATION
POINTS OF ALL INTERNAL LAYERS)

- SELECT WIRE

(AS SPECIFIED BY THE MRB)

- (1) STRANDED OR SOLID INSULATED WIRE

- 2) IF < 1 INCH WIRE MAY BE SOLID BUSS WIRE WITH
SLEEVING

- 3) IF < .5 INCH AND DOES NOT CROSS CIRCUITRY WIRE
MAY BE UNINSULATED BUSS WIRE)

- CUT TO LENGTH AND TIN WIRE

- ROUTE ON CARD

(HOLD IN PLACE USING MASKING TAPE OR ORANGE-STICK IN THE
CASE OF SHORT LENGTH WIRES)

- SOLDER WIRES TO TERMINATIONS

(SOLDER WIRES ONLY AFTER ALL COMPONENTS HAVE BEEN MOUNTED
AND SOLDERED)

- (NOTE: 1) WIRES SHALL BE TERMINATED ON CIRCUIT RUNS ONLY
IF NO OTHER ALTERNATIVE EXISTS
- 2) CROSSING WIRES SHALL BE AVOIDED IF POSSIBLE
- 3) NO MORE THAN 3 WIRES SHALL BE SOLDERED TO
ONE TERMINATION POINT
- 4) AVOID RUNNING MORE THAN THREE WIRES IN PARALLEL
IF POSSIBLE)

● REMOVE MASKING TAPE

● CEMENT WIRE TO CARD

(USE INSULATING CEMENT APPROXIMATELY 1 INCH INTERVALS)
AND ALLOW TO CURE)

● INSPECT FOR:

OPEN CIRCUITS

SHORTED CIRCUITS

CONTINUITY

SOLDER WORKMANSHIP

COMPONENTS ARE SECURELY MOUNTED

WIRING IS ROUTED PROPERLY

NO EVIDENCE OF BROKEN/DAMAGED CONDUCTORS

III SHORTED CIRCUITS

- ISOLATE SHORTED CIRCUIT
- DETERMINE LOCATION - SHORTED CONDUCTORS ELECTRICALLY

A. REMOVE CIRCUITRY - EXPOSED

- KNIFE CUT

(MAKE TWO PARALLEL CUTS IN CONDUCTOR A MINIMUM OF .015 APART AND REMOVE CIRCUITRY. BE CAREFUL NOT TO CUT INTO THE LAMINA)

- APPLY EPOXY TO CUT AREAS
- VERIFY SHORT DOES NOT EXIST

B. REMOVE CIRCUITRY - HIDDEN

(SUCH AS IN MULTILAYER BOARDS)

- CLAMP PWB - ON FIXTURE
- POSITION DIAL INDICATOR

(ON MACHINE SPINDLE TO MONITOR DEPTH OF CUT)

- POSITION END MILL OVER LINE TO BE CUT

(1) UTILIZE COPY OF ARTWORK FOR POSITION

2) END MILL MUST BE LARGER IN DIAMETER THAN LINE TO BE CUT BUT ADJACENT CIRCUITRY MUST BE CONSIDERED)

- CONNECT VOM

(ON THE FRONT LAYER OF THE PWB CLAMP THE VOM
TO COMMON POINTS ON BOTH ENDS OF THE LINE TO BE
CUT)

- SET VOM DC RESISTANCE SCALE

- ADVANCE END MILL

(VERY CAREFULLY, TAKING PROGRESSIVE CUTS OF .001
INCH DEPTH AND BACKING OFF)

- LOSS OF CONTINUITY

(STOP UPON LOSING CONTINUITY ON A BACKING OFF
OPERATION - THIS INDICATES THE LINE IS CUT)

- TEST FOR INDUCED SHORTS

(TO ADJACENT LAYER OR ADJACENT CIRCUIT LINE CAUSED BY
SMEARING THE COPPER DURING THE CUTTING OPERATION)

- PROBE POINTS OF ADJACENT LAYER/LINE

(WITH ONE END OF VOM STILL ATTACHED TO ONE
END OF THE CUT LINE. PROBE FRONT LAYER POINTS
OF ADJACENT LAYER OR ADJACENT LINE WITH THE OTHER
PROBE - REPEAT WITH THE OTHER END OF THE CUT LINE)

- IF SHORT IS DISCOVERED

(CAREFULLY HAND PICK TO REMOVE THE COPPER
SMEAR)

- VERIFY

(REPEAT THE TESTS FOR INDUCED SHORTS)

- APPLY INSULATING COMPOUND

(TO SEAL THE BARE COPPER OF THE CUT LINE)

- INSPECT 10X

(FOR DAMAGE TO SURROUNDING CIRCUITRY AND PARTS)

IV MISSING/DAMAGED PLATED THRU HOLES

A. INTERFACIAL HOLES

(RESTRICTIONS - THIS REPAIR WILL NOT BE USED WHEN MORE
THAN 5% OF THE HOLES IN THE BOARD ARE
DEFECTIVE WITHOUT A COMPLETE ENGINEER-
ING INVESTIGATION)

- REMOVE SOLDER

(FROM THE HOLE AND CHECK PAD FOR LIFTING)

- INSERT SOLID "Z" WIRE (SHOW FIGURE 4)

(USE 28 OR 30 AWG SINGLE STRANDED UNINSULATED JUMPER
WIRE AND CRIMP BOTH ENDS - Z WIRE)

- SOLDER JUMPER WIRE

- CLEAN BOARD

- INSPECT WORKMANSHIP 10X

B. COMPONENT MOUNTING HOLES

- REMOVE COMPONENTS

(AS REQUIRED TO OBTAIN FREE ACCESS TO AREA BEING REPAIRED)

- REMOVE SOLDER

(FROM THE HOLE AND CHECK PAD FOR LIFTING)

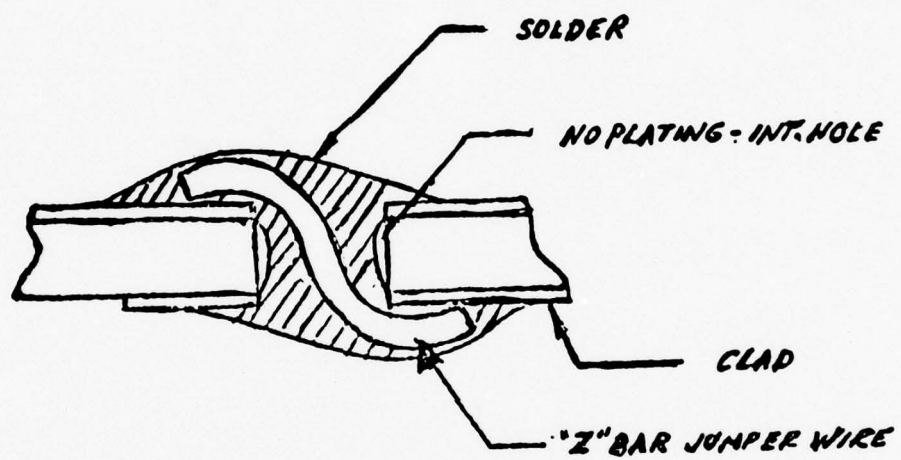

FIGURE 4

- INSERT COMPONENT
- SOLDER COMPONENT TO PADS ON BOTH SIDES
(OF THE BOARD)
- CLEAN BOARD
- INSPECT WORKMANSHIP 10X

V MISSING, DAMAGED, CUT CIRCUITRY

A. ATTACHMENT TO CIRCUIT RUN

(SHOW FIGURE 5)

- (RESTRICTIONS:**
- 1) THERE MUST BE A MINIMUM OF 1/8 INCH
ORIGINAL CONDUCTOR RUN ON EACH SIDE
TO BE SOLDERED**
 - 2) BROKEN OR CUT CONTACT FINGERS SHALL
NOT BE REPAIRED**
 - 3) ALL JUMPER WIRES SHOULD BE INSTALLED
AFTER ALL COMPONENTS HAVE BEEN
MOUNTED AND SOLDERED TO THE BOARD
THIS PROCEDURE CAN BE USED FOR STRAIGHT
CIRCUIT RUNS OR NONSTRAIGHT RUNS)**

● REMOVE DAMAGED CIRCUITRY

**(USE EXACTO KNIFE. PLACE KNIFE EDGE ACROSS A GOOD SECTION
OF CIRCUITRY AND CUT WITHOUT DAMAGING THE LAMINA)**

● CLEAN BOARD SURFACE

**(MAKE SURE ALL PARTICLES AND FOREIGN MATERIAL IS
REMOVED)**

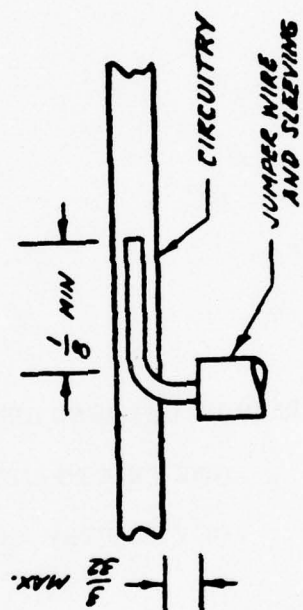

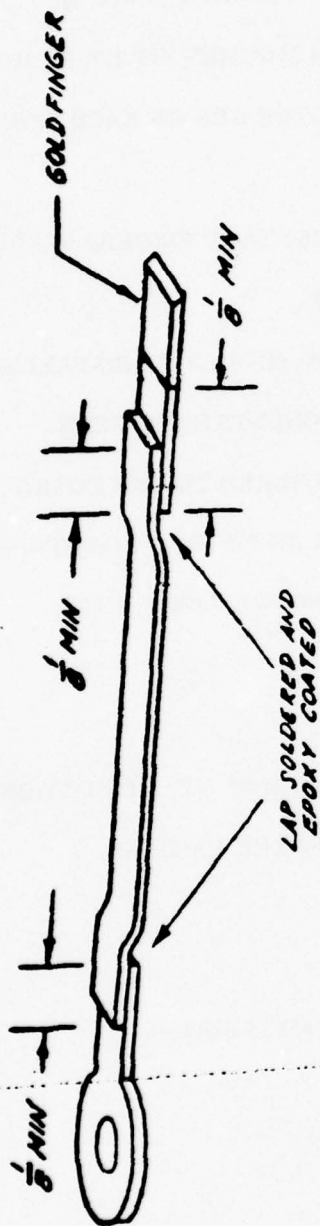

FIGURE 5

- CUT JUMPER WIRE/SLEEVING

(SELECT THE APPROPRIATE GAUGE WIRE AND SLEEVING SIZE AND PROPER LENGTH. PUT THE SLEEVING OVER THE BUSS WIRE. YOU CAN USE RIBBON IN PLACE OF JUMPER WIRE PROVIDING THE AREA TO BE JUMPERED DOES NOT EXCEED .5 IN. JUMPERS > 1 INCH SHOULD BE STRANDED COPPER WIRE < THAN .5 INCH DO NOT REQUIRE SLEEVING AS LONG AS THEY DO NOT CROSS CIRCUITRY)

- TIN JUMPER WIRE ENDS

(APPROXIMATELY 1/8 INCH FROM EACH END)

- PLACE WIRE ON BOARD

(FOR STRAIGHT RUNS FOLLOW ORIGINAL CIRCUITRY PATH. OVERLAP THE ATTACHED POINTS BY 1/8 INCH ON EACH END)

- SOLDER JUMPER WIRE

(ASSURE SOLDER HAS SET TO AVOID LIFTING, USING A HOLDING AID IF NECESSARY)

- INSPECT WORKMANSHIP 10X

- MIX EPOXY

- APPLY EPOXY

(APPLY A SMALL QUANTITY OF EPOXY TO THE ENTIRE LENGTH
OF THE REPLACED CIRCUITRY AND OVER THE SOLDER JOINT.
FOR NONSTRAIGHT RUNS USE EPOXY APPROXIMATELY EVERY INCH)

- CURE EPOXY

- INSPECT WORKMANSHIP 10X

B. ATTACHMENT TO FLAT PACK LEAD

(SHOW FIGURE 6)

(CLEANING OF THE BOARD AND CUTTING BUSS WIRE AND SLEEVING
AND TINNING OF THE BUSS WIRE IS THE SAME AS PREVIOUSLY
DISCUSSED FOR ATTACHMENT TO CIRCUIT RUNS) (ALL RESTRICTIONS
ALSO APPLY)

- PLACE WIRE ON FLAT PACK LEAD

(WIRE MUST BE PLACED ADJACENT AND PARALLEL TO THE FLAT
PACK LEAD AND HELD IN PLACE)

- SOLDER JUMPER WIRE

(REFLOW AND SOLDER JUMPER WIRE TO FLAT PACK PAD ASSURING
THAT SOLDER HAS SET TO AVOID LIFTING OF THE JUMPER AND
FLAT PACK LEAD)

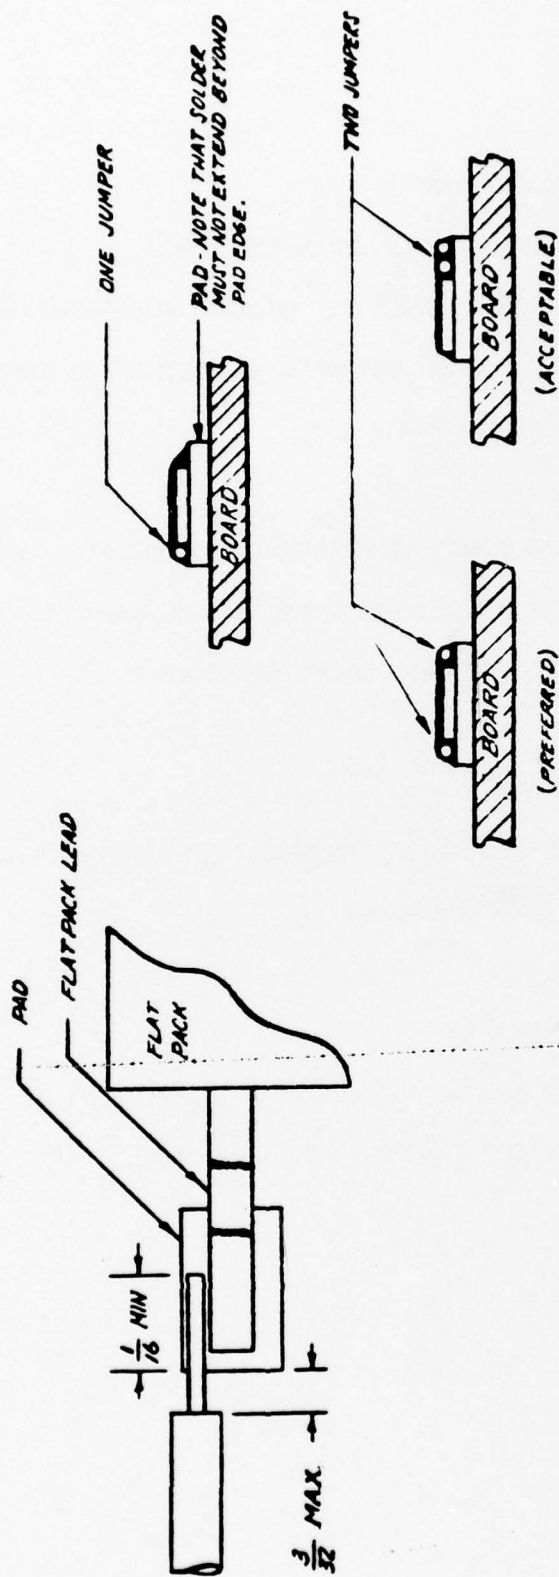

FIGURE 6

- INSPECT WORKMANSHIP 10X

C. ATTACHMENT TO COMPONENT LEADS OR TERMINAL

(CLEANING OF THE BOARD AND CUTTING BUSS WIRE AND
SLEEVEING AND TINNING OF THE BUSS WIRE IS THE SAME AS
PREVIOUSLY DISCUSSED)

- WRAP WIRE AROUND COMPONENT LEAD OR TERMINAL (SHOW FIGURE 7)

(WRAP END OF THE JUMPER WIRE AROUND THE COMPONENT LEAD
MAKING 1/2 TO THE ONE COMPLETE WRAP)

- SOLDER JUMPER WIRE

(SOLDER WIRE IN PLACE UTILIZING HEAT SINKS ON ALL TEMPERA-
TURE SENSITIVE DEVICES)

- INSPECT WORKMANSHIP 10X

(INSPECT FOR DAMAGE TO THE COMPONENT BODY AS WELL AS
JUMPER WIRE AND COMPONENT SOLDERING)

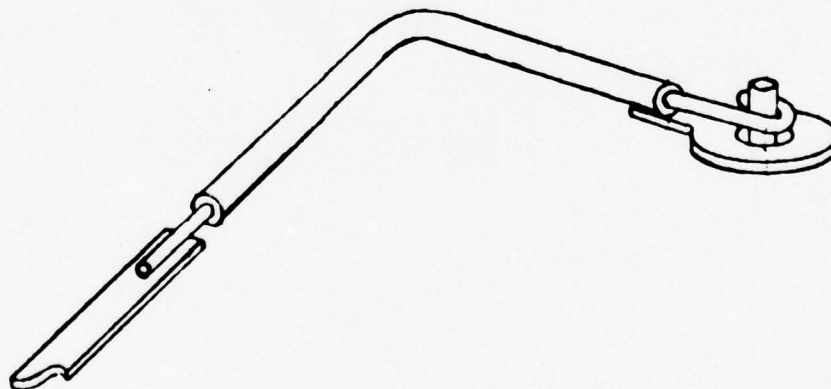

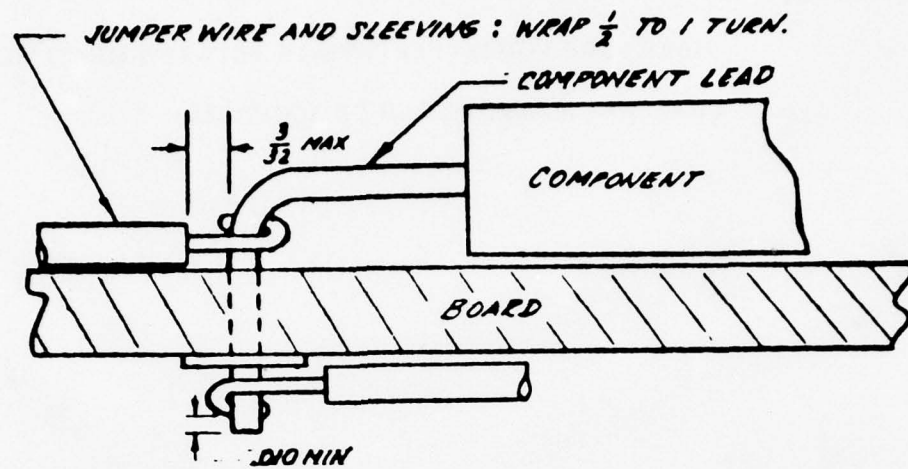

FIGURE 7

VI CRAZING

- DO NOT REPAIR

(MAKE SURE YOU DIFFERENTIATE BETWEEN MEASLING AND

APPENDIX T
MULTILAYER ASSEMBLY RELIABILITY ASSURANCE

General Electric Company

T-1a

**MLA RELIABILITY ASSURANCE -
A CONTINUING PROGRAM AT THE
AEROSPACE ELECTRONIC SYSTEMS DEPARTMENT
OF
GENERAL ELECTRIC**

PROGRAM OBJECTIVES

- MEASURE THE LIFE OF MLAs MANUFACTURED TO BASELINE PROCESS AND INCORPORATING STANDARD DESIGN FEATURES
- EVALUATE THE EFFECTS OF PROCESS AND DESIGN CHANGES ON MLA RELIABILITY
- RELATE TEST RESULTS TO PROGRAM SERVICE ENVIRONMENTS (PRIMARILY THERMAL)
- PROVIDE DATA FOR DEVELOPMENT OF ACCELERATED TESTS

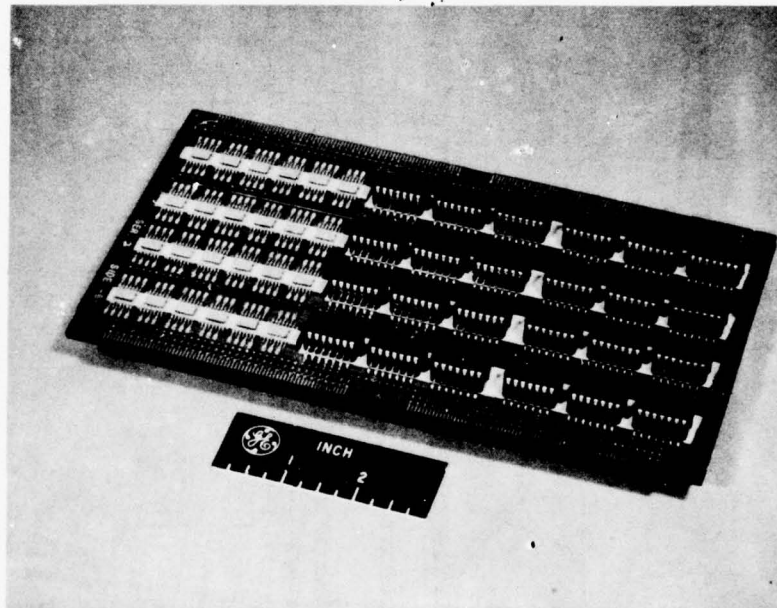

KEY PROGRAM FEATURES

- MLA TEST SPECIMENS WERE SUBJECTED TO ALL STANDARD ASSEMBLY OPERATION STRESSES BY MANUFACTURING PERSONNEL
- CONTINUOUS CIRCUIT MONITORING OVER TEMPERATURE RANGE
 - 5 ns ELECTRICAL FAILURE (>1 OHM) DETECTION CAPABILITY
 - 25 mA CONSTANT CURRENT SOURCE
- ACCELERATED TEST OVER TWO TEMPERATURE RANGES
- MLA TEST CONFIGURATION REPRESENTATIVE OF PRESENT (1973) AND PROPOSED AESD PROCESSES/DESIGNS

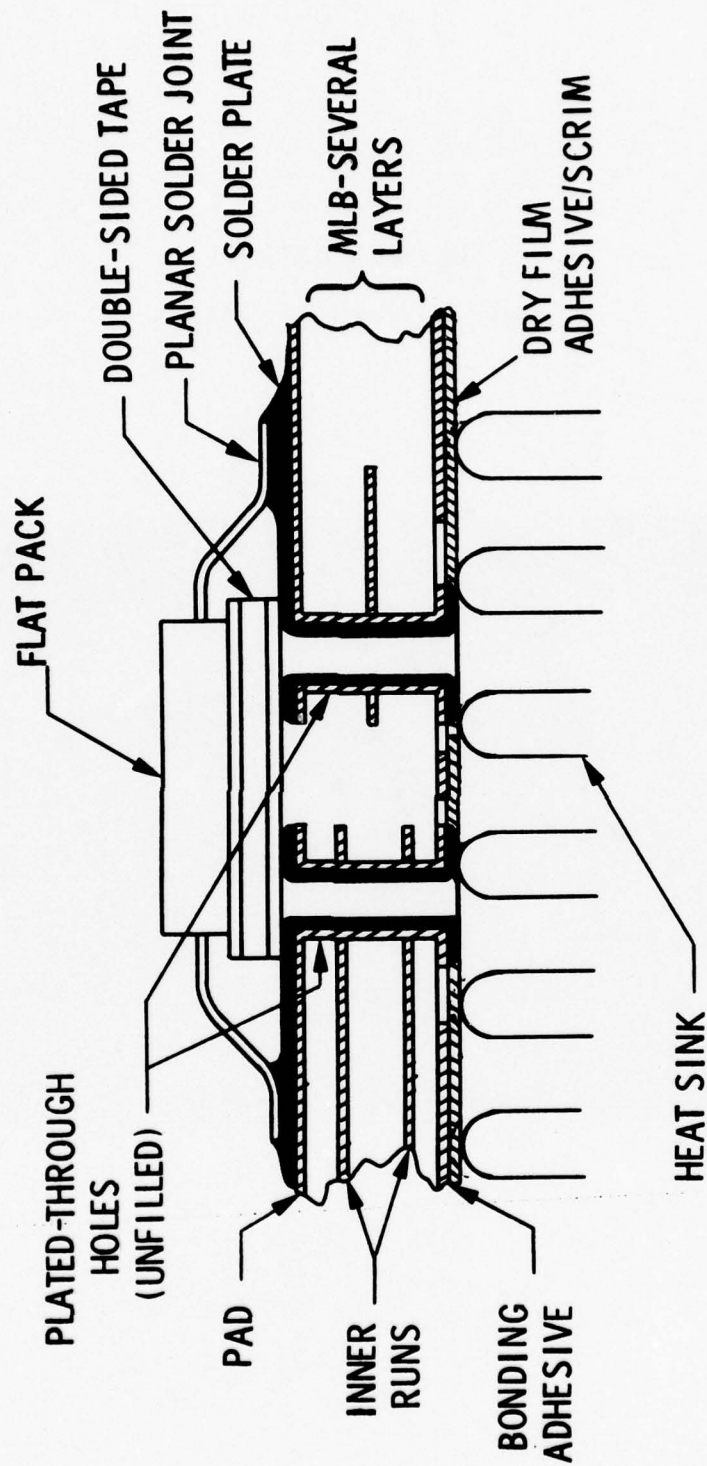

MLA TEST CONFIGURATION

- EACH 5" x 9" MLA CONTAINS:
- HEATSINK SANDWICHED BETWEEN TWO MLBS
- 48 FLAT PACKS - 672 PLANAR SOLDER JOINTS
- 48 DUAL-IN-LINE SOCKETS - 672 PLANAR SOLDER JOINTS

PLANAR ATTACH
MULTILAYER ASSEMBLY

CROSS SECTION THROUGH MLA

MLB FEATURES

- 12-LAYER GLASS EPOXY BOARD
- 1 oz AND 2 oz COPPER INNER LAYER COMBINATIONS
- 40 MIL DIA DRILLED HOLES
- >1.0 MIL AVG MIN PTH COPPER THICKNESS
- SOLDER FILLED HOLES
- 13 - MIL WIDE RUN ON 25-MIL GRID
- 1230 PTHs

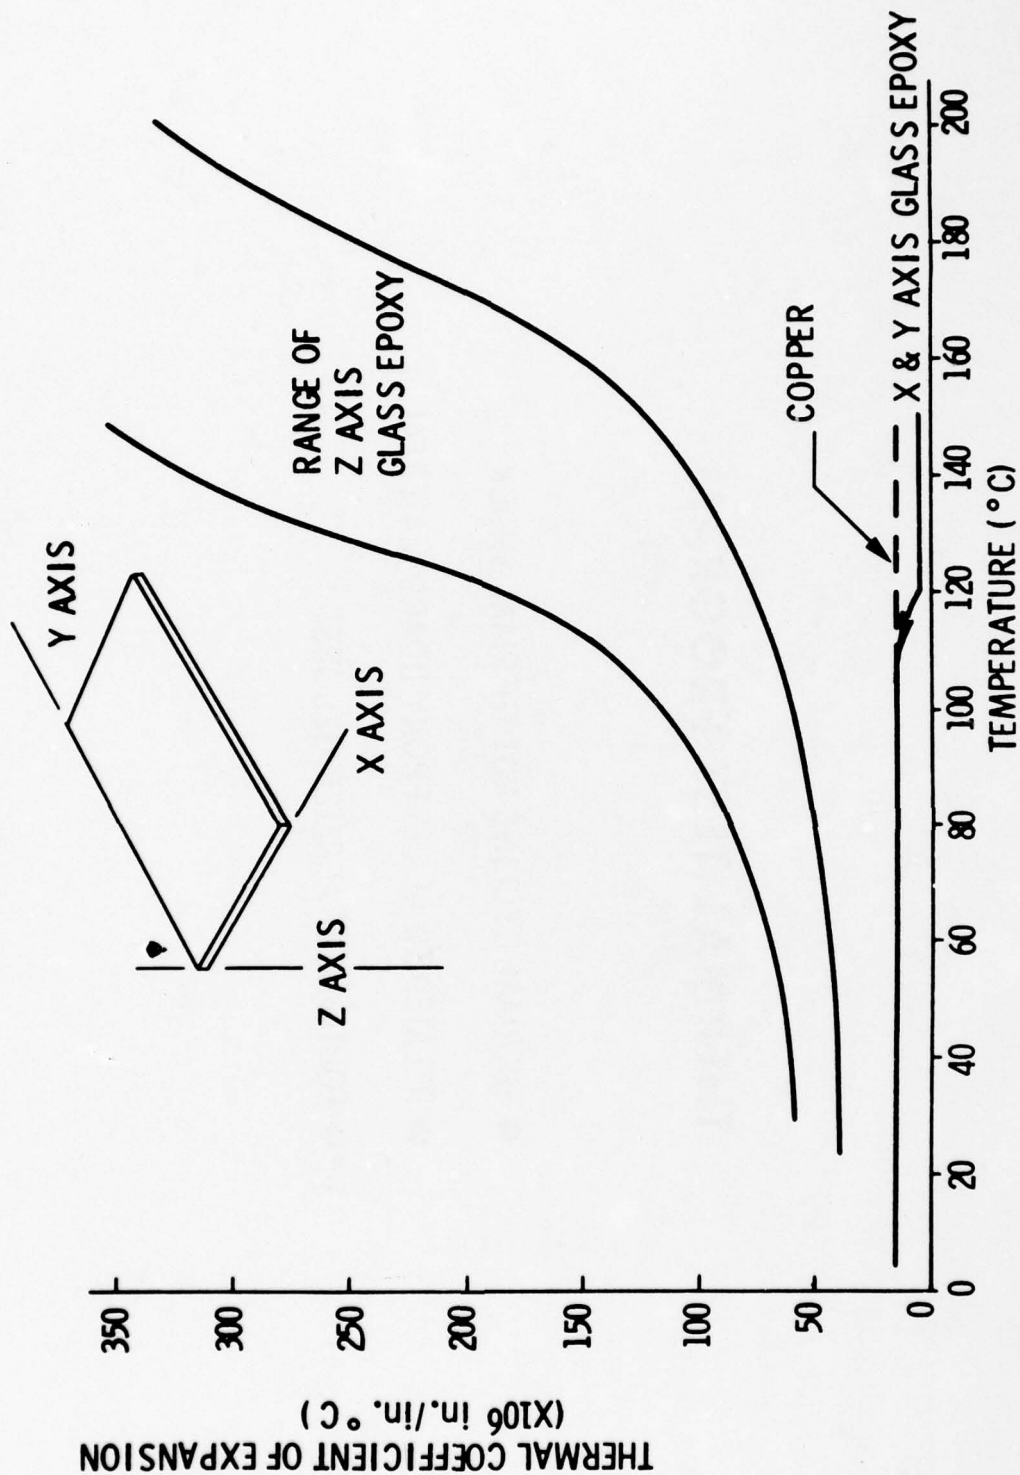

MLB TEST CIRCUIT DESCRIPTION

CIRCUIT	PLANAR SOLDER JOINTS	PLATED- THROUGH HOLES	CIRCUIT DESCRIPTION
A	168	0	SURFACE RUNS USED TO CONNECT 12 DUAL-IN- LINE SOCKETS
B	168	170	12 DUAL-IN-LINE SOCKETS CONNECTED IN SERIES VIA PTHs TO RUNS ON LAYER II
C	168	0	SURFACE RUNS USED TO CONNECT 12 FLATPACKS
D	168	170	12 FLATPACKS CONNECTED IN SERIES VIA PTHs TO RUNS ON LAYER II
E	0	22	LONG RUN WITH LONGITUDINAL, LATERAL, AND DIAGONAL LEGS EXTENDING OVER SEVERAL LAYERS
F	0	869	PTHs STITCHED TOGETHER AT VARYING CIRCUIT LAYERS

THERMAL TEST PROGRAM

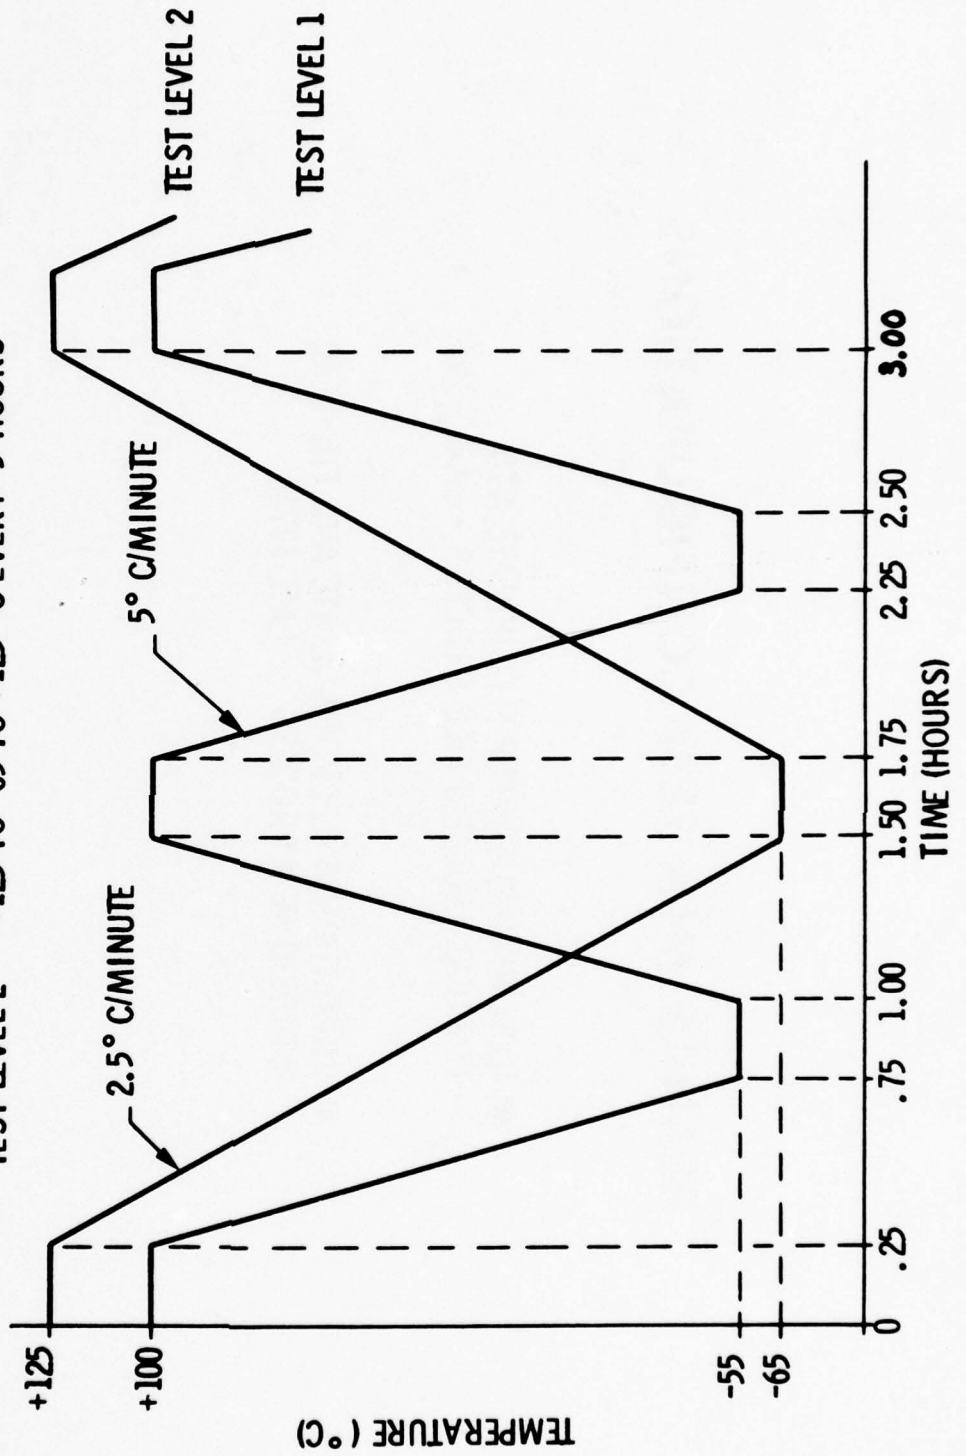

- THERMAL CYCLING NOT THERMAL SHOCK
- RELATED TO GLASS EPOXY BOARD MATERIAL
- EQUIVALENT ACCELERATED TEST

THERMAL COEFFICIENT OF EXPANSION versus TEMPERATURE

MLB TEMPERATURE CYCLE PROFILES

TEST LEVEL 1 - +100 TO -55 TO +100° C EVERY 1.5 HOURS
 TEST LEVEL 2 - +125 TO -65 TO +125° C EVERY 3 HOURS

PLANAR MLA TEST CONFIGURATIONS

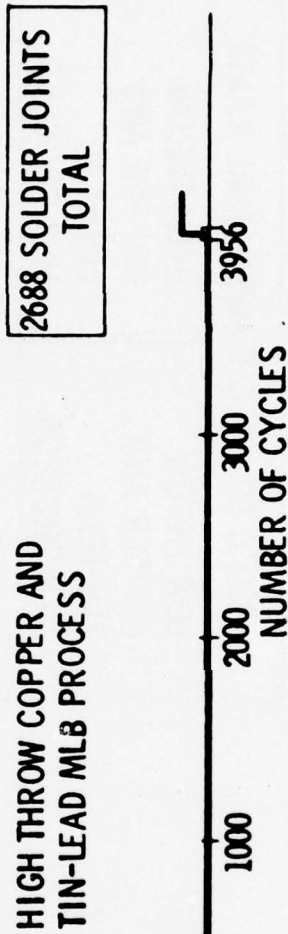

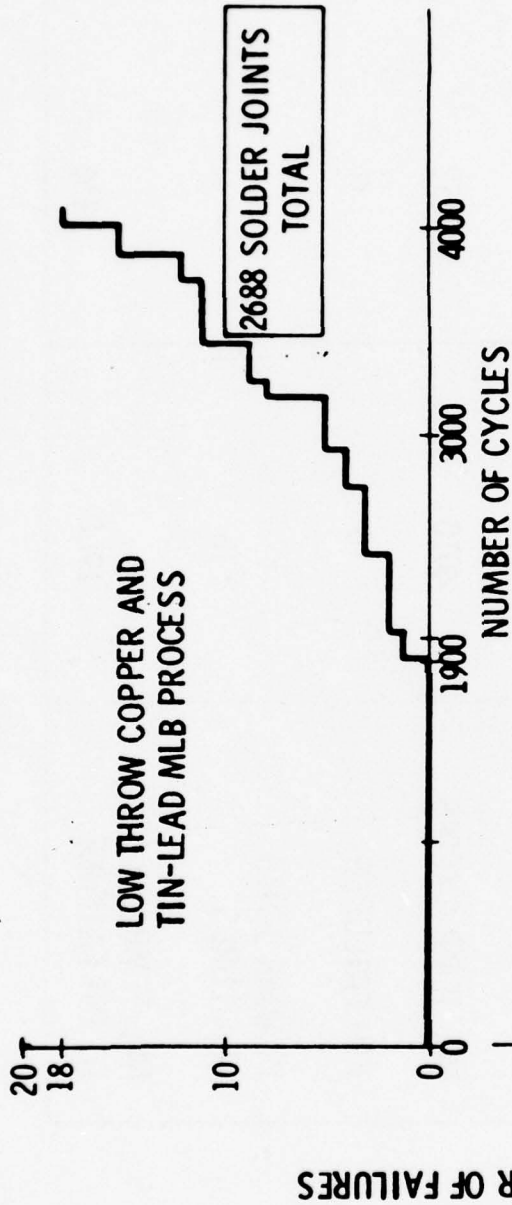

- (LOW THROW) COPPER FLUOBORATE AND
TIN-LEAD (SOLDER) MLB PROCESS - EARLY 1973
- (HIGH THROW) COPPER SULFATE AND TIN-LEAD
(SOLDER) MLB PROCESS - LATE 1974

PLANAR MLA TEST RESULT

672 PLANAR SOLDER JOINTS PER MLB 1231 PTHs PER MLB	+100°C TO -55°C TEMPERATURE RANGE	
	LOW THROW COPPER AND TIN-LEAD MLB PROCESS	HIGH THROW COPPER AND TIN-LEAD MLB PROCESS

LOW CYCLE FATIGUE EQUATION**

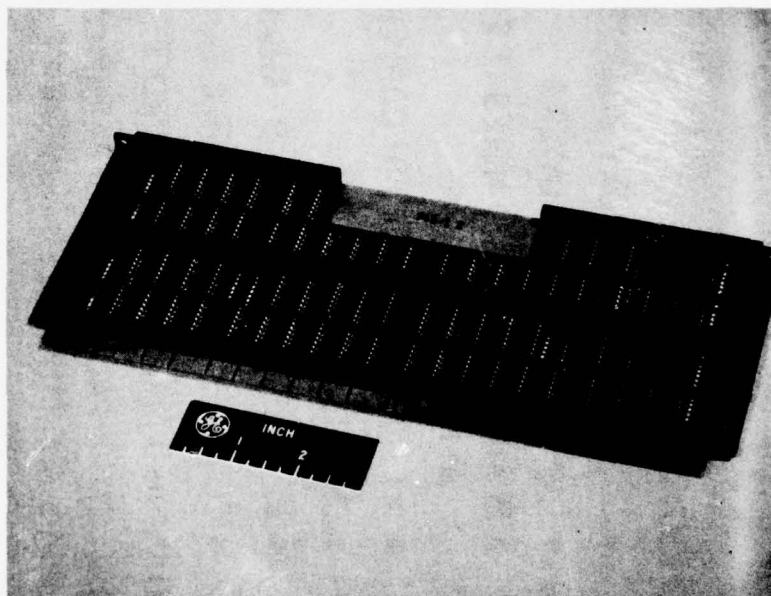

573 ⇔ 9800 (20 YEARS)

2493 ⇔ 37000 (75 YEARS)

MLA TEST CONFIGURATION

- EACH 5" x 10" MLA CONTAINS:
- 70 DUAL-IN-LINE PACKAGES - WAVE SOLDERED
- HEATSINK SEPARATING DIPS FROM MLB

DUAL IN-LINE PACKAGE/
WAVE SOLDER ASSEMBLY

MLB FEATURES

- **TYPICAL 1973 DESIGN**
 - 12 LAYER GLASS EPOXY BOARDS
 - 1 oz COPPER INNER LAYERS
 - 29 MIL DIA DRILLED HOLES (2.2 MLB ASPECT RATIO)
 - > 1.5 MIL AVG MIN PTH COPPER THICKNESS
 - UNFILLED HOLES
 - 10 - MIL WIDE RUN ON 20 - MIL GRID
 - COVER PATTERN (1231 PTHs)
- **STANDARD MANUFACTURING PROCESSES UTILIZED**
- **CIRCUITRY FACILITATED SEPARATION OF FAILURE MODES AND MINIMIZED NUMBER OF TEST CIRCUITS**

DUAL-IN-LINE PACKAGE/WAVE SOLDER

MLA TEST RESULTS

(HIGH THROW COPPER AND TIN-LEAD MLB PROCESS)

	+125°C TO -65°C TEMPERATURE RANGE	
	ALL 1 OZ. COPPER INNER LAYERS	2 OZ. COPPER ON 2ND AND 11TH LAYERS REMAINING 1 OZ.
NO. OF MLBS	6	6
NO. TEMP CYCLES	617	617
PTH FAILURES	0	0
SOLDER JOINT FAILURES	0	0
NO. TEMP CYCLES TO 1ST FAILURE	?	?

1120 LEAD SOLDERED PTHS PER MLB
110 SOLDER FILLED PTHS PER MLB

RANDOM VIBRATION RESULTS

INPUT: $W_0 = 2.0 \text{ g}^2/\text{Hz}$; 100 - 1000 Hz
 $\ddot{X} = 54 \text{ g rms}$

DURATION: 1 HOUR

RESPONSE: $f_n = 200 \text{ Hz}$; $Q = 20$
 $\ddot{Y} = 225 \text{ g rms}$; $Y = 0.4 \text{ inch rms}$

TEST RESULTS:
NO FATIGUE FAILURES

TEST PROGRAM CONCLUSIONS

- MLAs MADE WITH EITHER LOW THROW OR HIGH THROW COPPER/SOLDER ARE RELIABLE FOR AVIONICS/SPACE SERVICE ENVIRONMENTS
- MLAs MADE WITH HIGH THROW COPPER/SOLDER HAVE LONGER LIVES THAN THOSE MADE WITH LOW THROW
- BOTH FLATPACK (PLANAR ATTACH) AND DUAL-INLINE - PACKAGE (WAVE SOLDERED) MLA DESIGNS ARE RELIABLE FOR AVIONICS/SPACE SERVICE ENVIRONMENTS
- TEMPERATURE RANGE OF -65°C TO $+125^{\circ}\text{C}$ IS A VALID ACCELERATED TEST RANGE (i.e., SAME FAILURE MECHANISM)

APPENDIX U
TRENDS AND NEEDS

L. Katzin
The Aerospace Corporation

U-1a

TRENDS AND NEEDS

The conference, so far, has expressed the point of view of you, the contractors and subcontractors, your internal experiences with rework and repair, and also your experiences as related to SAMSO and to The Aerospace Corporation.

We at SAMSO and at The Aerospace Corporation are on the other side of the coin looking at you. We are constantly reviewing your documents and your hardware. We attend meetings at your facilities and catch "red-eye" flights to show up on short notice at your plants to help resolve problems. We listen very attentively to your technical discussions and to your rationales, and we present our own comments. Out of these many meetings, a group of typical and repeating answers have evolved, and just so you know that we listen, let me present to you my one and only slide of this presentation:

TYPICAL CONTRACTOR RESPONSES

"We're working on it."

"It's not in the contract."

"It conforms to our interpretation of the spec."

"Changing the dash number will cause a 6-month slip in schedule."

"This is the way we have always done it."

"Those failures were random mavericks."

"It will never see a qual environment in flight."

"We don't make it that way any more."

"That's why we have redundancy."

"We have never had a failure."

In a more serious vein, the things that I would like to discuss with you today are not so much on how to go about repairing or reworking an electronic assembly but rather some of the trends that I see in the advancing technology. This includes improvements that are already partly upon us, some of the things that we are overlooking, and the kinds of things that: "Wouldn't it be nice if...." Let me give you an example: The products we have been discussing, printed circuit board assemblies for spacecraft application, while functioning in their intended environment, will probably never see temperatures in excess of 150°F ; yet, in producing these assemblies we subject them to a 750°F soldering iron tip, and because of this high temperature exposure we must test our unassembled boards at temperatures that have no relationship to the space environment that the assembled boards are going to encounter. All we are trying to do is provide mechanical and electrical integrity to our resistors, capacitors, transistors, etc. We have gotten ourselves into the habit of using solder joints, which require very high temperature, which in turn degrades our printed circuit boards; and we then spend our time, energy, facilities and money trying to find ways of correcting the problems that we have created rather than using these resources to evolve better joining techniques that do not require high temperature. The real problem is reliable low temperature joint technology. Such a joint can be made either with a lower melting point alloy or with a very short cycle high temperature, both of which are possible today with a little additional development work.

The printed circuit boards that we use today are primarily epoxy glass, and some of the earlier speakers addressed the polyimide-glass board material, which is an improvement. With either of these materials, a major problem is its nonhomogeneous composition. Because of woven glass fibers in the laminate, every hole that we drill will remove a different amount of glass fiber, leave different lengths of glass fibers protruding from the walls of each hole and we end up with thousands of drilled holes in a group of "identical" boards that are produced on a "batch" system; and yet, every hole is different. The different amounts of glass at every hole will dull the drill a bit more and at an inconsistent rate so that even the hole diameters will be different.

Can't we find a homogeneous material on which to build our printed circuits and multilayer boards? A homogeneous material is not vulnerable to delamination, and with homogeneity it would also be free of microcapillary paths that can trap electrolytes and active neutralizers used in the processing.

If we didn't require the high temperatures for component attachment, we could consider using low temperature thermoplastics for our printed circuit boards.

An application for a homogeneous carrier that we are now using is in flexible printed circuits, or flex as it is called. In this application no fiberglass weave is used, and we deal only with the mylar or Kapton carrier, the adhesive layer and the electrolytic copper sheet. With flex, we have different problems: One is that we use it as a hinge, a use for which it was never intended. We have not devised a way to evenly distribute the flexure stresses over the length of the flex, and as a result we end up with sharp bends (hairpin bends) that can cause cracks in the conductors. One way to avoid this is not to use the flex as a mechanical hinge. Add a mechanical hinge to the product and let this hinge carry all the mechanical stressing. This hinge will also void a second problem, that of using the flex as a handle or a tow rope. By having the two members that are electrically interconnected with the flex also held together by a mechanical hinge, all the pulling and tugging will be on the hinge and not on the flex.

A "new" type of printed circuit that has not yet been discussed at this meeting is the metal core board. The metal core board is not really a new technology. It has been around for a long time, but has not as yet been accepted by the aerospace industry. Although the metal core board is no panacea, it does have some definite advantages for certain applications. This type of board is made with an aluminum core rather than the conventional epoxy glass. Because of its "different" construction it offers the following advantages:

1. Superior thermal conductivity
2. May be used as structure
3. Can have the aluminum core extended beyond the circuitry and then bent to form a chassis, a tray, a closure or a bracket.
4. The "Z" axis expansion problem disappears because of matched coefficients.
5. Provides a heavy ground plane

There is a reluctance to go to metal core boards partly because of inertia, and partly because the printed circuit industry has created an empire for their raw material suppliers. The suppliers derive financial benefits from the conventional laminates and they, like us, are reluctant to seek out or even accept changes. We've been designing and building hardware in a certain way; we have embellished our narrow spectrum specialties to a point that change can constitute a threat to our own position of recognized expertise. We are reluctant to try something new even on a parallel basis, a prototype basis, or on a developmental basis. We should remember that tomorrow's technology can be no more than what we develop and cultivate today.

I spoke of solder and soldering a bit earlier, but let me return to that subject for just a few moments. If you remember yesterday, someone was discussing syntactic foam. Syntactic foam, as you know, is a thermosetting binder that is heavily loaded with hollow microspheres (usually glass). These spheres, in bulk, look like flour, and if you were to sneeze they would be blown away in a cloud. The purpose of this foam is to allow for stress relaxation especially during thermal expansion. As the embedded parts expand, they push against the glass microspheres and crush them thus relieving the pressures.

Would it be possible to take these microspheres, etch them to roughen the surface, electroless copper plate them, and then put them (approximately 80% by weight) into a solder binder? This would give us, by definition, a syntactic solder. This solder would not develop stress cracks, because any stresses would be taken up by the cracked glass spheres. It might be worth looking into.

While on the subject of foams, lets take a look at the wonderful advantages that foam has to offer us:

1. Provides mechanical protection
2. Provides the equivalent of low weight structure
3. Gives thermal stability
4. Makes the structure almost immune from shock and vibration

When we come to repair and rework of foamed assemblies we are almost in a hammer and chisel act. We try to sandblast the stuff off, pick it off, cut it off and we come to the conclusion that it probably wasn't really intended to be reworked. However, if we were to take our assembled printed circuit board, put our conformal coating on it, perhaps a little leavier than is usual now, place an RTV membrane over the cured assembly and pull a mild vacuum on it, the vacuum will pull the thin elastomeric membrane down over all the parts on the board. Pour the foam over the membrane the same way you do it now. Allow it to blow and harden. The RTV will not stick to the board or the components on it but (perhaps with a primer) it will stick to the foam. This foam-RTV encapsulation can be snapped off the board with no damage to the encapsulated or the encapsulant. It can be reused as long as part size and placement are not changed. You can even do total encapsulation (top and bottom) by placing a nylon thread around the periphery of the board and having one end extend out. You can now open the package by pulling the string all the way around much like opening a pack of cigarettes. This vacuum technique does work. I did it many years ago with beautiful success. You might want to try it.

Multilayer boards have probably been misused more than they have been properly used. Would you believe that as many as 75% of multilayer applications could have been satisfied with two-sided boards? What would you do if multilayer boards did not exist or if they were outlawed for space programs? Simplifying is always more difficult, but simplicity is usually synonymous with reliability. The use of multilayer boards should be the last design consideration, the last resort. It should be the approach that you don't consider until you've really been convinced that there's no other way to go.

Let me tell you right now that I know that there are cases where the multilayer board is the best way to go; however, I should also tell you that I have never seen a need for a 25-layer board (or even an 18-layer board). We have enough problems in producing simple two-sided, plated through hole board. When you examine the material and process complexity of such boards with the wet side of the process, the dry side of the process, the rigorous testing and the small quantities involved in our applications you know that even the simple two-sided board is not simple. Just remember yesterday's papers on the reworks and repairs to "simple" two-sided boards. We spent an entire day talking about repair problems. They must be real.

It really goes without saying that if a two-sided board is complex, then a multilayer board must be even more so, and it is. Some things that should be done when it appears that you may require a multilayer board are:

1. Keep the number of layers to a minimum. If you use computer aided design (CAD) be careful. CAD designs usually have 25 to 40% more layers than are needed. This is because the computer makes the designer lazy and when the machine reaches a crossover, it may simply say "add a layer", and the designer will buy it. It is the easy way out.
2. Don't be satisfied with the first design. A second and a third cut will almost always reduce the number of layers.
3. If you can, use bus bars. Bus bars have been around for a long time, even before printed circuits, and today we can get them as neat laminated assemblies that can carry the ground and the voltage and at the same time provide the filtering capacitance between them. By running the bus down the middle of the board, perpendicular to the board, it provides good stiffening and may raise the natural frequency of the board into a low amplitude, non-damaging zone. The bus bar will save you layers, cost, and design time.
4. Don't take the attitude that once you have concluded that a two-sided board won't cut it, you can use as many layers as you want to, because you are now in the multilayer mode. Not true. Every layer adds complexity and reduces reliability.

You know, at one time we thought that with the advent of IC's, MSI's, LSI's our systems would become smaller and our printed circuit boards less complex. This, of course, didn't happen. What did happen is that our system complexity grew at the same rate as our device complexity and we now have larger system functions on a given board than we ever dreamed possible. This has produced a new problem. The number of input-output (IO) leads has increased for many applications. To help relieve the situation, the Zero Insertion Force (ZIF) connector has come into being. When you have a couple of hundred pins on a connector, it could take two men and a boy to engage and disengage it. To date, ZIF connectors require a lever, a wrench, or a screwdriver to remove the contact pressure for zero force insertion and withdrawal. The need for better ZIF connectors is going to become more and more important to us in the future. The use of conventional connectors is going to become more restricted. We won't have the space and we won't have the force. Think about it. This is a problem that we are going to have to face very soon.

Two techniques that have started to make inroads in the aerospace hardware are wire wrap (or solderless wrap) and stitch welding. The wire wrap, although space consuming, does provide the ability to incorporate changes both easily and reliably. This is important to the aerospace designs that are produced in such small quantities that they never fully emerge from the status of prototype. Stitch welding has similar advantage but with less volume utilization and with less change flexibility. A better technique is needed for spacecraft interconnection that will provide a maximum change flexibility in a minimum of space. These attributes are especially needed for board-to-board interconnection. It is not difficult to visualize the complexity of rerouting, adding, and/or deleting a couple of dozen wires from a 12-layer mother board. We need a better way, and wire wrap and stitch welding are only partial answers, although both are gaining in popularity and both have been flown.

The point that I want to make is one that I have made earlier but it is important enough to repeat. Make all of your designs as simple as possible. Any fool can design a complicated machine. It doesn't require genius to design something that is complicated. Where genius really shows up is in simplicity. It's not always appreciated. People will look at it and say: "What's so great about this? There's nothing to it." But it's the "nothing to it" that makes it great, and that in itself is the reward of a good engineer.
